A giant chicken in the guise of Tommy Kuei-che Hwang clucked:

> What is available for the Atari machines in terms of ethernet?
> also which Atari would I need? I must use TCPIP protocol.

Its "TCP/IP". It looks goofy without the slash. I belive somewhere within the Network directory at Umich, there is a DIY project for a VME ethernet card. To run such a card you'd need a Mega STe or a TT. I've heard of Ethernet interfaces that connect to the parallel port, but I don't know were to get them. (or if its a DIY project) This interface would work on any Atari, but then you couden't use a parallel printer...

All these ports are, are standard serial ports. Get a Macintosh-style null modem cable, and use your favorite serial port networking software.

How much RAM does Minix use? I've been haveing problems with term, it keeps looking for a .term/termrc file, since I'm not running MinixFS I can't make such a file. I'm running a very small MiNT setup with 1mb RAM. Anyone know of a

TOS file system friendly term?

: wrong with the HSMODEM6 patch?
I have a TT as well, and as far as I know, Modem 1 won't go faster than
19200 bps, even with the patches. If you want the higher bps rates, you
need to use the other serial ports. Serial 2 is best, since it has
"standard" bps rates and is a "real" RS-232 port. Depending on what
communication program you have, you will get better speed out of all your
serial ports if you using HSMODEM (Connect doesn't need it).

I find ftp to work very well across a PPP link. If it's not quite as fast
as Zmodem due to the higher over head, it's not much slower. And you can
actually do things online while you're ftping directly to your machine.
Even with a fast modem, tying up the machine while downloading using a
protocol like Zmodem is irritating...

Just my point - the calibration is lethal to a Cubase Audio system, but some manufacturers (like for example Conner) don't have any calibrating hard disks. They are not needed and some manufacturers make "A/V" drives just to get rid of the calibration that wasn't necessary in the first place and sell them a lot more expensive. As I said before my Conner 1GB and 2.1GB work perfectly in my studio, which I use very frequently, both recording normally 8 or 16 tracks and recording to make complete mixes for whole CD's and I have never had any problems at all - even though these drives are not A/V drives. So my conclusion is that A/V drives are not needed at all.

> and things cooled down.

That rings a bell somewhere. I've heard that the Wing SIMM cards have had a problem with disturbing both the diskdrive and the internal hard drive. If you have a Wing card that might very well be the reason for your problems and that you could solve it by moving the FDI. I believe that new Wing cards have another layout and don't have this problem any more.

> A good test if the drive is good for audio is to put HOW_FAST.PRG to

The speed can be important, since the drive is more sensitive to fragmentation if it reads slower.

Thanks for the tip on HOW_FAST.PRG, where can I find it? I will soon be able to access Internet for real, so is it available somewhere out there?

> But CAF bypasses the hard disk driver when playing/recording audio. It

Hello,

my brother teach greec. For the moment he has to prepare his textbook with pen
and paper.
On the computer he use Wordplus 4, which in fact is a version of That's Write.
To typeset the textbook he needs a greec font. This font must have the complete
ancient alfabet (with accents). The only font I knew that's meets this
requirements is a old That's Write font. The problem is that he can't load this
font in Wordplus 4
Does someone knew how he can solved that.
Thanx in advance

Hi Dave,

> Can anyone tell me what is the current version of Selectric. Is it
> still being developed?

I run Swedish support for many fine shareware programs, including Selectric. The latest official version is 1.10E. Some time ago I received 1.11E beta, but Stefan hasn't made it an official release.

My personal opinion is that Stefan Radermacher has stopped developing Selectric for reasons only known to himself.

Following in the footsteps of Selectric is Freedom. One may even say that Freedom has taken the concept even further, in that it supports the AV-protocol and multitasking very well indeed.

Freedom is being develpoed as we speak! If I were you I'd take a look at the current Freedom 1.14E. It's slightly crippled (some would say very crippled...) in its unregistered form, but you'll be able to try it out before parting with your cash.

I'd say Freedom - with all its nice and useful little features - saves me about three minutes every working day. Available from better BBSes and, of course, Hensa.

Best regards

****** SUPER MIDI SEQUENCING PACKAGE FOR SALE! ******

1-1040STE with 4 megs of ram/TOS 2.06/Atari mouse. Unit is very clean and well maintained. Would be "like new" except for small cigarette burn on case that I polished out so you can barely see it.

1-C-Lab Notator/Creator SL package. This is actually _2_ sets of disks for both Notator _and_ Creator, along with _2_ dongle cartridges - one for Notator, one for Creator. You could set up _2_ systems with this software - one w/Notator, one w/Creator (of course you'd need a second ST as well). The Notator disks have the latest updates to version 3.21 or maybe 3.22 (I'd have to look). Full manual, disks, all in perfect condition.

1-ICD Link 1 with software, manual and ACSI-to-SCSI cable. We used this to hook up our floptical drive (21 meg removable) but you can use it to hook any SCSI drive to the 1040STE. I use an identical unit to access my cd-rom drive, SCSI HD and floptical - works great! The Link, cable, disks and manual are all like new.

1-SM124 Hi-rez mono monitor. No burn-in and the "100% failure rated" 2.2uf bipolar capacitor has been replaced. Case is clean, but has a bit of the mounting pad for a mouse holder that was stuck to it on one side of the case. Unit has been tweeked to expand the image (it's BIG). This is the monitor that C-Lab recommended for use with Notator SL.

FREE BONUS! Buy the package and I'll split shipping 50/50 via UPS/COD within the continental USA and throw in _50_ disks of arc'd and unarc'd Atari utilites - the cream of hundreds of hours of downloading before I went to floptical storage (grin).

I want $500 USD for this system and I want to sell it _as a system_! I'll think about selling individually only if no one picks it up as a unit. So you're welcome to bid on individual items, but your bids will be considered _after_ those of package buyers. Please, no silly low-ballers - don't waste your/my time. For those of you who want an individual item, here's the breakdown:

1040STE.....$280 You can see that the package price
Notator package.....$175 is very reasonable and even the
SM124.....$60 single item prices are well within
ICD Link.....$60 market value for used gear!

Total.....$575 ** Package price = $500! **

If you buy individually, you pay shipping UPS/COD and no free disks! ;)

If this system is so great, why am I selling it? We got a Falcon and Notator Logic! Works like a charm, but now I have to make back _some_ of the upgrade cost (grin). Please send replies to my Internet address at Delphi - it's "johnhechtman@delphi.com". Or you can call me at:

HOME - 212-586-4633 / WORK - 212-246-2444 - ask for John Hechtman

Some folks said they sent me email that I never got - so feel free to call if you don't hear from me - I want to _sell_ this STuff!

I've just spent 20 mins searching my ST mags for the address which I'm sure was
published recently but with no luck, however one of my contacs gave it to me but
I can't read the writing very well but it looks like: mrsdi@bnfl.co.uk (it might
be mrsd1). This is for Mac Sys Data of POV, he is the main coder of the menus
and demos but I don't think that he was responsible for raytrace but try it out
I'm sure he'll help you if he can.

If you really want to know how it works then I can't help. But if you just want to get on and do it-easily then ftp to: micros.hensa.ac.uk and go into the directory: micros/atari/tos/n/n127 and then type "mget *.*" then de archive i and all will become crystal clear. It's a really good program and it does far more than UUencoding but it often hangs on me but I think it's jus my setup.

3696. MONSTER ST OF CSA CONTEST

Newsgroup: comp.sys.atari.st
Date: 1995-09-10 00:00:00 UTC
From: bertil.jagard@p14.straight.ct.se
Message-ID: <ftn_2.203.221.14_94e06529_Bertil.Jagard@p14.straight.ct.se>
Source record: 159266

In a Message of <05-Sep-95> Kevan Winch writes:

KW> How far has anyone gone in upgrading a plain vanilla Atari ST ?

A bit! :-)

KW> I would love to hear of some 'Monster STs' in existence !

Ok! Here we go!

Started off as: Atari 1040STE + SM124

Current upgrades: Midi-Tower, MegaST keyboard, 4Mb ST-Ram, TOS 2.06, PAK
68/3 40Mhz, FRAK030 with 4Mb TT-Ram, MagiC 2.01E+TOS 2.06
in eprom on the PAK, AdSCSI hostadapter with internal
clock, 341Mb + 1050Mb harddiscs. Patched RS-232 to 38400
Baud, Modem2 + LAN both at 115200 Baud, HD-III and
1.44/720 discdrive + 720 as B-drive, CD-Rom, DAT-backup,
SM124/VGA-Mono and a colour monitor. V.34/V.FC modem,
Canon BJ-200e + Star LC10-Colour, External
printerbuffert.

So whats left of my 1040STE is the motherboard!..:-D

Regards Bertil Jagard SysOp at STraight BBS..

3699. [Q] EMail addr. for author of EB ED POV, and a bug

Newsgroup: comp.sys.atari.st
Date: 1995-09-10 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <42tkf8$efi@status.gen.nz>
Source record: 159269

I have recently been using EB ED POV for the first time to do more than a few primitives. It all goes very well really, except for image maps.

When I select image_map in the pigment dialogue, I click on the ________.GIF button, and a Fileselector appears. Here I choose the filename of the image to be mapped. However,if the filename was, say, "A_PIC.GIF", EB ED POV makes it into "A_PIC.GIF.GIF, or sometimes, "A_PIC.A.GIF". Then POV can't find the image of course. This does not seem to occur when bump mapping an image.

Also, EB ED POV seems to like putting a rotation of x -90degrees into the pigment, even if I don't want this. This has the effect of making the image come out wrong, as you can see.

The other bug is that often I make a CSG object, and sometime after I made it, I want to add some more objects into it. So, I go into the CSG editing dialogue, and select some objects that I've just made. Lets say the CSG is object 20, and the object I want to add in is object 70. Well, I add it in, and all seems fine, until POV tries to raytrace it. Now because the new object is #70, and the CSG is #20, the new object is written into the POV script after the CSG which has a reference to the object. POV then complains that there is an undefined identifier in the CSG. So, I end up havign to undo the CSG, delete it, and make another CSG with a higher number than the object. This makes the CSG work. Now, this is already a big hassle, but there's more. Because the original CSG was deleted, all the object numbers above #20 (or whatever number the deleted object was) are moved down one to close the gap. Then all the CSGs that are already defined that opint to an object after #20 are all pointing one number too high. It seems that EB ED POV does not udate existing CSGs after a change in the numbers. I have to go thruogh manually re-doing themall for the right number,

Has anybody else had any luck with these bugs?

Apart from this, I have had few problems (I have not encountered the problems I have seen mentioned by some other users myself, for example being unable to exit popup menus, I just click the right mousebutton and it seems to do the trick.)

Also, does anybody know of the email address of the author (or does he not have one?) Doe anybody kbow of a later version than the one posted to ftp.cnam.fr in Jan '95? I seem to have version 1.84d Dec.94.

EB ED POV could turn into an excellent programme if these few bugs were ironed out, I hope the author is still developing it.

No , but like a lot of the BBS / network / mailer software for the atari it
is in constant development/upgrade, all of my users comment on how easy the
system is to use from their end...
Having run it for about 3 years since it was first brought on the scene it's
in a state I would consider 99 0.000000inished apart from one small known bug which
should be fixed in the next version.
It can be run without a key so you can set up your BBS , try it and when you
consider it ready , register to get all the features.
If you would like to try it it should be on

ftp.demon.co.uk in /pub/atari/octopus/ in the next week.

I will be uploaing updates to there as and when they appear.

The current version is 0.66

Source record: 159275

I have a few questions about a 1040STFM that I just bought with a SM124
monitor....

.how do I find out what version of TOS I have, and how do I
upgrade it?
.what is the difference between a 1040STF and a 1040STFM?
.can I upgrade the memory to mmore than a meg? If so, how much?
.it came with Cubase 2.0, but i have no docs for it... does
anyome have the docs?
.the monitor is slightly skewed to the right... can I correct this?

Thanks for your time, esp. if you can help out!

Terrence

I've always wanted to know how to FTP in the background. The only way I've
figured out how to do it is to do the entire FTP session in the backgroung...
How do you do start an interactive FTP session, start it grabbing stuff, then
pop it in the background? (btw: this is from a shell account, I can't just open

another ptty-thingy under Xwindows or anything similar... And no, I have no
desire to install a SLIP/PPP line on my 1mb ST with 2400 baud modem...)

3711. ICD Software for Zip Drive

Newsgroup: comp.sys.atari.st
Date: 1995-09-10 00:00:00 UTC
From: Dennis McGuire <mcguired@moose.erie.net>
Message-ID: <Pine.LNX.3.91.950910222622.12215A-100000@moose.erie.net>
Source record: 159281

Has ICD de-bugged their software for the Zip drive? Last I heard
there were problems with "write fail" errors, but that was about 2 months
ago.

RM>have the Western Digital WD1772-02-02, you will need to replace it with
RM>the Atari AJAX controler. The -02-02 is important. As for Formating

No thats wrong, the WD1772-02-02 is designed for 8Mhz and all HD-Kits push the Floppycontroller to 16Mhz, so your 1772 may work for months (or years) but one day it'll break. Remember: 1,44MB Floppies on the ATARI need the AJAX-Chip.

RM>AJAX controler chips are available from BEST Electronics, $40 each he

Go out and buy this.

You're right. MagiC does not need a fix. But HSMOD improves the speed.
So, without HSMOD you don't get problems, but with HSMOD it's just
better!

Library(blue door) is not relevant. Use the charged mace.
Take it to your hand in the screen and use it like a key
(touch the door with it), not like a weapon.

3717. TOS 4.92 NVRAM BUG?

Newsgroup: comp.sys.atari.st
Date: 1995-09-10 00:00:00 UTC
From: nuuja@cc.Helsinki.FI
Message-ID: <42ta2d$j5j@oravannahka.Helsinki.FI>
Source record: 159331

It seems evident that ALL Falcon ROM versions (at least TOS =<4.04) have the fatal NVRAM bug. This means that ALL FALCON COMPUTERS _CAN_ BE DISABLED WITH A SIMPLE PIECE OF SOFTWARE!!! The only cure other than replacing the clock chip is to use a special cartridge to reset the NVRAM. So avoid messing with your NVRAM.

There's a possibility that TOS 4.92 still has this bug. If you don't want to see this bug in the TOS 5.0, please take my message to the C-Lab TOS team or help me to reach them by e-mail.

The end of the world is coming... (I'm not talking about TOS 5.0!)

What exists for the Atari that will allow connection of
PPP from a UNIX shell account? Sort of like Tia is to Amiga, Mac
and MS platforms. Thanks..

3719. Mintnet: lynx and inetd question.

Newsgroup: comp.sys.atari.st
Date: 1995-09-10 00:00:00 UTC
From: simon@bassland.anglianet.co.uk
Message-ID: <810707038snz@bassland.anglianet.co.uk>
Source record: 159333

Hello all. Could somebody help me out on these following problems I have with MintNet.

1. When inetd is run from rc.net; I get the message "/pipe/log not found". How can this be solved?
2. I have put a passwd file in /etc. But what is the proper syntax of each entry in this file? I.e. What do they mean?
3. If I try to ftp my machine from my other Atari, all I get is the message stated in question 1 (above), and the session closes.
4. When I use lynx, I can select 'D' to Download a picture. After the transfer has finished, I get the option to save to disk; except it doesn't! I notice the 'html00?' eppear in the /tmp directory, but no file saved with the filename I give! What needs putting into the 'lynx.cfg' file?

Sorry for a long list of not-so-perfectly-worded questions :) But any help would be much appreciated.
IMO, I am very happy with Mint+MintNet+MiniXFS+Thing desktop, as I can still use the desktop, and have my Falcon connected to my local ISP, via 'modem1' and my ST via serial2!!. I am trying to stop using Nos altogether you see. The reason why I still use 'Nos', is because of its pop3 mail support as well as SMTP. BTW: This version has only just recently appeared on Demons ftp server.

Thanks again, Simon.

Source record: 159334

Paul Booth (P.A.Booth@bradford.ac.uk) wrote:
: Hallvard Tangeraas (hallvart@oslonett.no) wrote:
: : I'm curious about what SLIP/PPP is....

: : I know that it's some sort of "direct connection" to the net
: : as opposed to the usual terminal emulation that I am using now
: : via Connect, but this is just about what I know.

: : What are the pro/cons compared to a terminal emulation connection,
: : how do you set it up, what is needed of software/hardware...?
: : I'm grateful for any information.

: PPP = point to point protocol
: SLIP = not sure :) I think it's Serial Line interface Protocol or
: something similar.

Ah, it doesn't matter--- servers are capable of supporting both--- they
do essentially the same thing, but PPP is newer and SLIP is being phased out.

: These are ways of implementing tcp/ip over serial lines on computers so
: you can network them together.

: Since tcp/ip was developed primarily for the internet if you get a
: ppp/slip connection with a computer connected to the internet then it's
: possible to become a site on the internet too.

: I.e. you have your own ip address, etc...

: The upside of it is that your computer is actually *on* the 'net so you
: can run Web Browsers, Ftp clients, Gopher, etc. and have the resulting
: files downloaded straight to your computer instead of going through a 3rd
: party host.

Right--- all of these are available directly to you--- you don't have to
go through a unix/vax account to use 'em. However... you will need
dedicated FTP/GOPHER/Telnet/browsers/newsreaders in software on your
end. I don't know how well it works on Atari's, but on Macs & PCs,
you're able to have multiple windows of everything running @ the same
time: for example, you can have multiple telnet sessions, have an FTP
session, and be browsing the web at the same time, with all of them
active--- no time sharing.

Doing this for the first time is great- Most unix accounts allow you to
break in and out of programs via control-Z. Have you ever wished you
could still be doing something productive online while you doing a download?
With PPP one can be downloading in the background and still have another
telnet window open(albeit with some speed loss). This is something that

I've always wished could have been possible in the past when I frequented BBS's...

: The downside is that unless you have a leased line or some other
: permanent connection that your computer is only temporarily on the
: internet, so telnetting to it to collect mail is impossible. There are
: ways around this using POP3 which is a mailbox format you can collect by
: telnetting to a specific port and it downloads it.

Well, actually, normally you'd still have your standard shell account, in which you could use your normal mail-reader(I use PINE) instead of a remote program (ie. Eurdora on the Mac) to do it locally.

There really is NO downside to compared to a standard shell account---since you could always just telnet to that instead(and perform like normal)... eh, actually, yeah,there is a downside: You need to have it all set up right & have the proper programs to do the things you want. Currently, TCP/IP and SLIP/PPP software on the ST is rather difficult to set up(on the mac, it's a matter of putting a file in the system folder and restarting... on the PC, you have to install a bit of software...then you're off).

: Also because tcp/ip was developed for ethernet systems, the code isn't
: optimised for speed and so ppp/slip connections are inefficient compared
: to offline readers, sz and the like...

TCP/IP is very fast, actually-- it's reasonably efficient... people have actually used PPP connections on PCs and Macs @ 2400baud, just for the benefits of having multiple telnet windows(have a mud window open and one to your email account).

I think the main advantage of TCP/IP is that you're able to multitask on the internet...

: The main ways to go are NOS and MintNET. Depending on what sort of
: connection you're looking they vary in how easy they are to set up.

: No other hardware's needed apart from a modem, enough memory to run them
: and preferably a hard disk...

Probably a 14.4k or higher modem as well. Still, other implementations of SLIP/PPP and TCP/IP on other machines are quite a bit more polished...

3722. Re: PC - ST compatible diskette formats

Newsgroup: comp.sys.atari.st
Date: 1995-09-10 00:00:00 UTC
From: jonas.moller.nielsen@p7.dada.ct.se
Message-ID: <ftn_2.200.136.7$fidonet.org_3052b77e_Jonas.Moller.Nielsen@p7.dada.ct.se>
Source record: 159336

What kind of files do you want to transfer from the ST to the PC? any file that is stored on an TOS-formatted 720-kbyte diskette will be read on the PC. If you only want to transfer textfiles you only have to save the file (textdocument) in ASCII, or non WP-format. If you happen to use Papyrus or any other more modern word processor on the ST you can save the file in RTF-format. This format kan be read by most word processors on PCs and Macs. So a special program for converting the files from ST-to PC-format is not nescessary since there does not excist any specific ST-format concerning textfiles or picture files.

Yours sincerely
Jonas Mï¿½ller Nielsen

Start syslogd before inetd.

: 2. I have put a passwd file in /etc. But what is the proper syntax of
: each entry in this file? I.e. What do they mean?

Standards vary, but the most common format would be:

username:password:uid:gid:full name:$HOME:shell

Where:

Username is up to 12 character username
Password field can be blank. Most systems use * to indicate the
presense of a shadow password
Uid & Gid depend...
Full name can be anything
$HOME is the directory you live in upon login: /usr/azog
Shell is any shell available on your system

: still use the desktop, and have my Falcon connected to my local ISP,
: via 'modem1' and my ST via serial2!!. I am trying to stop using Nos

I take it you did a mod to extend the internal (normally useless)
modem1 port to a real connector? Can you give any details?

>suttle differences in the ROM product for UK use. The same is true for
>for the 1.6 and 1.06 labels that some folks use.
This can't be true.
The initial movement for the renumbering of TOS versions came from the US. I have the initial Atari notices around somewhere. Also, if you look at stuff from Pratt and others (such as his definitive list of TOS versions posted here again recently) you'll see he refers to TOS 1.04 which by implication is a US version (they were never consistent in their numbering and would equally refer to TOS 1.4 in Delphi confs etc!).

The differing numbers *do not* signify country of origin. There is another code in ROM for that OS configuration bits at _sysbase + $1C.

I'm sorry but this is just the sort of thing that has added to the total confusion on this issue. The answer is MUCH simpler. Atari wanted to change the numbers after the event and buggered it up!

: Now what do I do with it?
: 1) I have the recently posted Atari FTP site list

I suggest first of all if you don't have much Unix knowledge, then you
should invest in a book called THE WHOLE INTERNET User's Guide and
Catalogue by ED KROL 2nd Edition (O'reilly & Assoc.). For the beginning
"surfer" this is a MUST HAVE piece of Literature. Follow it's
instructions and you won't make a "dog's breakfast" of ftp.

: 2) Where can I find the Atari Web sites list thingy?

Providing your site has lynx try this URL

http://www.dl.ac.uk/MISC/ATARI/atari.html

it's a good starting point to other links.

: 3) How 'bout IRC? (channels to look out for, nick's to look for...)

I personally find it a waste of time, and it is generally inhabited
by immature juvenile's who's main preoccupation is sex.

: 4) Any other goodies?

Get Ed Krol's book and also if you can afford it, The Dummie's Guide to Unix,
and the Internet Yellow Pages.

```
: What are the pro/cons compared to a terminal emulation connection,
: how do you set it up, what is needed of software/hardware...?

First of all, if you want this type of connection, forget about ATARI.
Unfortunately, we do not have the "universal" software that you will
find on PC's and Mac's.

This type of connection allows you to DIRECTLY dowload all your mail,
news, software etc., into your computer without having to send
commands to your Net providors server i.e. if you use a shell a/c.
and so therefore, if you are in a country that has timed local call's
or your providor charges you my the minute/hour, this makes your
actual online time minimal and supposedly cheaper.

Using a web browser like Netscape, Mosaic, Chimera etc., on this type of
account means that you can view all the graphic and sound wonders of the
net. If you were using Netscape, and you went to my home page, you will
be greeted with a sound sample from Marvin The Martian, but unfortunately
you MUST have either a PC or a MAC running Netscape to hear this.
You cant hear this on an ATARI. If you have the TAF disks installed
on a Falcon with 14meg then you will see all my graphics. Unfortunately
we ATARIAN's have been left way way behind as far as net stuff goes.

You dont need to know any Unix commands either.

The only con is that it cost's you more than a shell account.

Hi Atarians! I wonder if theres any graphic Internet browser
available for Ataris now. I want to use my 1040ST with Monochrome to hook
up to the Net from home.
Best Regards!

3734. 4mb 1040STF/software for sale

```
1040STF w/ 4mb RAM
SF314 disk drive
1st Write Plus
Degas Elite

make me a reasonable offer, sale or trade. I recently got a new
STE, so I don't need two 1040s.

(if you're interested in trading, let me know what you have.
I'm looking for GFA Basic, a good database, monitor switch
box, or video hardware).

> it doesn't matter if parity is on or not.

I would like to know how that can be done - could you please send some more
info on this?

> As far I know there is also a replacement available for the internal
> interface that can handle up to eight SCSI units and parity

Not from Atari, but I think I've seen something from ICD.

Best regards,

Claes

I have to make a little correction, since C-lab has dropped the sequencer development to E-magic, who continue the Notator/Logic series. C-lab work more with hardware now.
Unfortunately, E-magic don't seem so much interested in the Atari market, but more on the Mac. They still don't have an audio version that works properly with the Falcon. Steinberg has had it for a long time...

Best regards,

Claes

: s> doing something wrong with the HSMODEM6 patch?

The TT030 serial ports can support much faster rates (some of the ports go faster than others - I can't remember the exact rates, but I think they vary from about 100K to 300K.) The problem is most likely that your software does not support the faster rates. CoNnect does, and I believe Flash 2 does also.

As far as HSMODEM6 goes, it may be worth installing it anyway, as it's supposed to speed up the software which drives the serial port, making even the TT030 ports act a little quicker, AFAIK.

A club member uses a 28.8k BPS modem on a TT030 and doesn't seem to have a problem.

Simple, dial the telephone number of the providor of your choice.
Type in your login name and password, and then proceed to activate
your account some Unix commands. IF, you dont know any Unix, then
I suggest you go to your nearest technical/computer shop and
purchase a book or two about unix, without any unix knowledge, you will
be unable to activate a shell account.

> monitor....
>
> .how do I find out what version of TOS I have, and how do I
> upgrade it?

ST Type is a small program which tells various stats about the system.
I got it through Suzy Bee's Software (advertised in ST Informer, or at
Toad). Profile is another (commercial?) program which tells even more.
I believe the author posts here sometimes, so watch for such postings.

> .what is the difference between a 1040STF and a 1040STFM?

The STfm has a modulator, so that you can use a tv as a monitor, or
output to a VCR. There is an extra RCA jack, which must be plugged into
a computer/tv convertor, as used by video game machines, available from
Radio Shack, etc. You can't have the mono monitor plugged in and use
the modulator at the same time, as one of the circuits in the cable
is "mono detect" which automatically puts the ST in high resolution.
Use a colour tv, because you'll lose some resolution, a tv is not as
high resolution as a monitor.
>
.can I upgrade the memory to mmore than a meg?
If so,
how much?

Yes; 2.5 or 4 Megs.

> .it came with Cubase 2.0, but i have no docs for it... does
> anyome have the docs?
` .the monitor is slightly skewed to the right... can I correct this?

Yes, if you're brave, you can take off the cover, reach back to the rear
end of the picture tube, there are two rings which can be rotated in
relation to each other. These control horizontal placement. Of course,
the monitor must be on, and connected to an ST. There is a program
called mono align, which displays squares, circles, etc. to aid in
such adjustments. There are dangerous voltages present inside any tv,
which is what a monitor is, so be careful, or leave it alone!

: How do you do start an interactive FTP session, start it grabbing stuff, then
: pop it in the background? (btw: this is from a shell account, I can't just open
: another ptty-thingy under Xwindows or anything similar... And no, I have no
: desire to install a SLIP/PPP line on my 1mb ST with 2400 baud modem...)

Somewhat understandable <g>...anyway, to put an ftp session in the
background, I ftp to whatever site I want to go to, set binary transfer
mode (if I remember :P). If I want to grab more than one file from a
directory without prompting, I type prompt to turn prompting off, and use
mget with either a wildcard or a list of files. Hitting ^Z will return me
to my shell, and typing bg puts the ftp session in the background. When
the transfer(s) are done, you'll see a notice on your shell screen, and
you can type fg to bring the ftp session back to the foreground. You may
even be able to log off while the ftp session is running in the
background, and it'll still keep on going...

You can connect your TT 2 your Falcon through a program called Power
Dos, you can then transfer files at approx. 115Kb/s
The program works happily with f.ex. TT,Falcon trough lan and a 520 ste
trough midi.

3750. Give your IBM the Look and Feel of an Atari ST - $45

Newsgroup: comp.sys.atari.st
Date: 1995-09-11 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DEqx1A.Jsl@freenet.carleton.ca>
Source record: 159214

I have several complete copies of GEM version 3 (the last release
for IBM), together with a copy of GEM draw for sale for only $45
(all original/ licenced, with manuals, packaging, etc). This
software runs on any IBM compatible (XT up to a Pentium) and
gets along with any DOS above 3.1.

With GEM installed, you IBM suddenly takes-on the personality
of an Atari ST, but runs all of your favorite DOS programs from
a hassle-free desktop environment (one familiar to any ST Atari
user). You can format disks (even the 1.44 variety), run your
CD ROM, copy files, launch applications, etc. just as you would
on an ST (it even provides support for desktop accessories,
several of which are included in the package.

In addition to running all DOS applications (even those which can't
be run from within Windoze or DOS Shell, this software allows you
run dozens of IBM-native GEM applications (including recent
releases of Ventura; a DTP package rivaling Calamus, Page Streamer
Caligrapher, Payprus, etc.). The IBM GEM desktop can even be
loaded into high memory on 386 machines (using DOS 6.X's MEMMAKER)
so that GEM uses no conventional memory. GEM for IBM can even be run
in an IBM window (serving as a much better file manager than the
one supplied with Windoze). This capability means that you can
also multitask IBM-native GEM applications (GEM draw, Ventura, etc.)
along-side windows and DOS aplications, running concurrently).

GEM was originally written in the earlier 1980's for IBM and was
subsequently recoded for the Atari (this explains the high common-
ality betwwen the Atari and IBM versions). In the IBM environment
it didn't get its break (due to the market advantages enjoyed by
Microsoft). However, newer versions of DOS have breathed new life
into GEM for IBM and this handy desktop seems to be just hitting its
stride, running today's much more powerful DOS applications and taking
advantage of the better memory management capablities of newer DOS
versions (GEM for IBM sits on top of DOS, just as GEM for the ST
sits on top of TOS).

No, GEM for IBM won't run ST applications (get the unrelated GEMULATOR
if you want to do that). GEM for IBM isn't emulating anything. Its
just running DOS and IBM-native applications from a much more user
friendly interface; in my opinion the best interface availible to
any IBM user.

Version 3 (dated 1990) will work with your VGA/ SVGA monitor and
virtually any mouse you are using. I have only three copies of this
excellent desktop (including GEM Draw and related desk accesory package)

available for sale at $45. First come first served.

Please note that I also have 2 copies of the earlier GEM 1.x for IBM which pre-dates and APPLE-launched lawsuit (against Digital Research) more closely follows the ST with regards to its desktop layout (trash can, resizable desktop windows, etc.). The desktop of version 1.2 displays at a slightly lower resolution (640x350 - 16 colours), but this doesn't affect the applications you run. The price of the 1.2 package is the same as the 3.0 package - $45 (Canadian)

Whether you pick GEM 3.0
or 1.2 you are way ahead relative to other user interfaces available for your PC (including the DOS prompt, WINDOZE and DOSSHELL

Regards,

Keith M.

There is a program called PowerDos that connects TT 2 Falcon trough the
LAN port, you can then transfer approx: 115KBytes/s
You can allso connect the TT,Falcon network with a 520 f.ex. (trough the
midi ports) and use it as a printer server..
There is allso a program called ConNect (pardon spelling) a Shareware
communications prog. that can connect trough the LAN port (i have not
tried this though..:-)

recently i picked up a 1040st with a copy of cubase to rig to my emax se sampler. it seemed to work fine in the store, but when i brought it home... problems! the screen in cubase seems as if it needs more room and the "buttons" on the tape recorder display at the bottom are jumbled over each other. is this because i am using a color monitor, or something far more insidious? if it is the monitor, does anyone need a color monitor in exchange for a monochrome? also (lastly, whew!) i need the docs for cubase 2.0 and any help i can get. quick response appreciated so if it is a serious problem, i can return the faulty machine (i hope).
Thanks a lot,
joshua chiet

3756. Re: MIDI / Forth / Atari ST

Okay, I found Formula, at ftp://bigbird.csd.scarolina.edu/pub/formula as advertised. Except I can't get it to build! Very frustrating, because I printed and read the manual and I think it is just what I was looking for...

I have an Atari 520ST, memory expanded to 1 meg, TOS version 1.4 (rainbow). I have Forthmacs 1.1. I checked the 'flags' source file, then did an 'fload load', and it starts building as expected, but in 'machine.st', around the definition for '(set-default-mask)' or 'set-default-mask', it sort of loses its mind (appears to me like Forthmacs gets confused about its context, because it starts complaining about each word, including '\' and comments it shouldn't be parsing at all).

I've looked at many of the source files, fiddled with the flags and commenting out some of the code, made sure I had no accessories and stuff eating up memory ('memfree .' always gives me over 100k), put debugging stuff in to try to narrow the problem down, but I'm basically stumped. I need a clue, or else just a pre-compiled FORMULA.TOS (which the manual implies was part of the original release disks).

Final clue: the end of the 'load' file says it is the 'Mladen Milicevic CUSTOM VERSION'. Could something have been tweaked in this version for a later/bigger Atari ST or Mac that would prevent it from building on a 520ST? I'd really appreciate any help anyone can give me. Thanks!

Hi-

I know I've asked this before but it's been a few months ago...

I just bought a copy of DiamondBack 3 and I'm looking for a good SCSI tape drive for my Falcon. I was originally hoping to find a QIC-80 format drive but I've since learned that those are primarily for MPM, and little (if any) are available for SCSI. Someone suggested QIC-150- is there anyone out there using QIC-150 or maybe even QIC-80? help would be appreciated!

David (lamarth@delphi.com)

3758. Q: SyQuest EZ 135-Drives

Is there anyone out there currently who is using an EZ drive on the lower level Atari's [ST/STe/Mega] in conjunction w/ICD Link.

I'd like to know if it will work before plonking my cash down on it. Seems like it is a better bet for us non-falconeers, what with the parity probs etc. running a Zip drive on our machines.

ICD seem hopeful, but have yet to get a unit to test it out. Looks like a nice prospect...

...if you know, either way, please email me or leave a msg here.

Thanks.

Andy

I am new to the 'internet' and 'newgroups'. I read several messages about a game called GranDad2. I got the game (several times from differnet sites) and failed to get it to work. It unzips ok, no errors, but when I run it if fails after the 'G2' screen ... when the music from the 'MOD' file is suppose to run. I've tried is on a 1meg 1040st with TOS 1.4 (1.04), and a 4meg 1040ste with TOS 2.06. In both cases there wre no acc or autoprograms in memory, just grandad. Has anyone out there got it to run?

I just though of an idea for a web browser: Why don't we have a server program
that can be started from a shell account on a Unix box handeling all the
network stuff, then have a client running in the Atari end displaying
everything? This would do away with a big hairy MiNT/MiNTnet setup, and would
ideally run on an 520st! I only wish I had the skills to pull it off! I'd think

HTML browser could easily be adapted to be a client!

>Cheers,
>Martin R.
Following my last post I have just seen a screenshot of ICD's RatheHd program
and after searching the Link disks I found it so I thought you might like to
look at the results of both a 100mb ZIP & my Quantum EL170s hard drive. And
just incase I didn't mention it last time, Iomega no longer really plans to use 25meg
disks as they just aren't in any sort of demand atall.
Tests were on a 4meg STe with The ICD Link 2. Although I see no reason why it
will change on a lower spec setup.

Access Rate(K/Sec) Seek Rate(Ms)
Quntum EL170s 961 21
Iomega ZIP 100 862 34

As you can see the ZIP is incredibly fast and if you use a file copier like
Kobold then it works an absolute dream. Also I would very much rate it over the
the Syquest mechanisms in terms of general ease of use and user frienliness BUT
I would be VERY interested in a reading from a Syqest 105mb or similar drive
with a SIngle BGM partition and tested on an ST with Ratehd. If anyone has this
info please post it!

This .sig does not waste space-But I do, by my very existence.

The REVIEWER

"NOT a diskmagazine"

I have great concern over the amount of software reviews
available for the ATARI, The glossy magazines and disc based
magazines all have review sections,these are usually a great source
of information, unfortunately in my eyes they have two drawbacks,
There isn't enough of them, this complaint cannot be levelled
at the producers of the publications as they can only allow so
much space to each section of there disc/glossy magazine, Are
they reviewing up to date software or indeed are they reviewing
software we really want to see, there are sections in AEO and the
like, these unfortunately although there are plenty can be quite
small,

"I refreshingly enough, do not want anything from you"

But I do have a plan, "The REVIEWER" will be to put simply a
disk full of reviews, these will be where appropriate accompanied
by full colour screen shots,
I will be making a shell (that will be Falcon etc compatible)
to display the review and pictures all in the same file, there
will be no fancy intro or annoying music, just a pleasant user
friendly menu system and a whole load of reviews,

There will be one extra section and that will be the "Authors
corner" or some such named area where authors can have their say,
maybe their product has been updated or indeed maybe the reviewer
has got it wrong, But I do feel there should be a place for
authors to give their opinions if they feel they need to, maybe
even inform us of on going projects or programs recently released,
in fact absolutely anything an author wants to mention, but this
will be the only section other than reviews and will be without
exception for authours only,

There will be no free pd on the disk or anything like that,
just the displayer and the reviews (along with screen shots) and
hopefully authors bits and thats it!,

Subject matter: Anything at all Atari related will be reviewed
whether it be software,hardware commercial or public domain,

Release dates will be as and when it's ready, this notice is
going to be posted everywhere I can get it (you are probably
going to be sick of seeing it), If I get a massive response (!)
and there is enough to fill a couple of disks then I will do, and

release one a day, doesn't bother me at all, if there is very little response (as usual) then the disk will still continue but not as regular, I don't really care whether anyone contributes a review or not, more for me to do:), in other words unlike diskzines, this publication will not rely on contributions, but will be more frequent and infinitely more interesting if you write the reviews, if you want to submit a review then please take note,

Everything submitted will be used unless it is deemed to be an excuse to attack a program,distributer or author, bad reviews will be used, all out attacks will not,

You must include your name and a publishable contact address, this can be home or e-mail or whatever, as all reviews cannot be checked then a lot of trust is involved, there must be some way of getting back to you if there is a problem,

You can review something that has already been reviewed, in fact it is positively encouraged, the reason should be more than obvious?

Do *NOT* send me software, this is not a cheap and nasty way of getting free stuff sent to me, I do not want anything sent to me other than reviews and if possible pictures,

Do not review anything *you* have produced yourself, or indeed anything your best mate has just knocked off, try and get someone else to review it for you, you can always ask for something to be reviewed,

This production is *NOT* to be used as a form of advertisement for any pdl or bbs, therefore you must not include an address for purchasing the product, commercial names and software houses can of course be mentioned, prices for commercial products can be mentioned, but anything that can be obtained on a widespread basis ie: from pdls or bbs's must not be tagged, this will hopefully ensure that certain pdl's will not take the hump and decide not to stock this publication,

If you have no way of grabbing screens then no worry, still send in your reviews, they will all be used,

The REVIEWER will be public domain, no copyright will be held and no person or persons will be allowed to make a profit from it in any form,

Remember it's anything Atari, including Hardware, Software, Magazines, Books, Diskzines, Calculators!, Consoles, Falcon, etc.

Any contributions (reviews) or indeed any thoughts on this idea that *IS* going ahead no matter what, then contact me at:

```

I connect my falcon into a PC network by running Ghostlink under Windows95
and mounting networked drivesd from the PC onto the falcon - works quite well,
and the Ghostlink server runs as a background task on the PC. Lets me mount
remote hard drives and CDROMS over the network (from any PC, not just my own).

Otherwise, get a DLINK 600 card and the MiNT-net ethernet driver & do it properly...

Craig.

The Falcon is more ST/STE compatible than the TT, because of a more flexible video-chip. There are more running on the Falcon, than on the TT, only some games runs on the TT. Also most new games that runs on the STE, also runs on Falcon, but often
not on the TT.
By the way, it's also possible to enhance the CPU performance on the Falcon, if that's needed. There are a number of different accelerators avaiable.

3780. v34 on Falcon ?

Newsgroup: comp.sys.atari.st
Date: 1995-09-11 00:00:00 UTC
From: m9003@oden.abc.se
Message-ID: <4318lv$rj8@oden.abc.se>
Source record: 159296

Is anyone in here running v34 vq on a Falcon ?
I just got a Dynalink modem and I'm having problems with baud negotiating
at login. I get CONNECT 38.800 but then it turns out to be 2.400.
I'm using STalker and have tried Connect - same thing.
Any Ideas ?

Cheers,
Martin

Hi,

The strange thing is that since several months, papyrus 4 is announced in big ads in the german magazine ST-Computer, just as if everyone could purchase it (IIRC 250,- DM, 350,- DM for papyrus Gold). I had sent an update order to R.O.M. but did not get any reply.

After having waited for many, many weeks, I called Ulli Ramps from R.O.M. He told me that the delay is due to the decision to build a system independent version of papyrus with interfaces to TOS/MagiC, MacOS and OS/2:

Any later changes of the program would require to modify the universal version only, so further development easily integrates the three mentioned operating systems in one step. This way, you can be sure to always have an up to date version of the program, no matter if you still use TOS/MagiC.

Basically, this is mentioned in the big ads, too (available for 3 operating systems), but nowhere you can find a hint that version 4 is still under development :(!

According to Ulli, everyone who had wanted to purchase papyrus 4.0 got papyrus 3.6 with a certificate for a free upgrade, as soon as the actual version would be ready. It only is a very sad thing that they did not tell anyone who has ordered an _update_ about the current situation. With the ads in ST-Computer giving the impression that this product _is_ available, I (like probably many other users) felt like a fool ...

Well, the call was about 3 three weeks ago and I was told that the new version still requires "a few weeks". I haven't heard anything new yet.

Bye,

Christoph

You can connect your TT 2 your Falcon through a program called Power
Dos, you can then transfer files at approx. 115Kb/s
The program works happily with f.ex. TT,Falcon trough lan and a 520 ste
trough midi.

3784. Vidi ST Questions

Newsgroup: comp.sys.atari.st
Date: 1995-09-11 00:00:00 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <DEqxzH.Kxt@freenet.carleton.ca>
Source record: 159300

I just picked up a used Vidi St package from a friend who told me that it wasn't working well. I'll be trying it out later, but, after a quick inspection, and a look at the very small docs, I had a few questions:

What are the two variable resistors near the video in, and the variable one on the main board for? They aren't labeled, and I see no mention of them in the doc that was included in the package.

Is Rombo still selling Vidi St's, and, if so, what is the latest version of the SW, and do they have a repair service? What is their current postal address? Thanks!

3785. Help with KA9Q/NOS

Newsgroup: comp.sys.atari.st
Date: 1995-09-11 00:00:00 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <95254.115957STIRRE31@MAINE.MAINE.EDU>
Source record: 159301

I've gotten a SLIP account at my university and have been trying to
get NOS to work but have had no luck thus far. I am using a Falcon
4/85 with a Hayes 2400 baud modem (I will invest in a higher speed
if I can get it to work).
First of all, my account has a dynamic IP address and the NOS docs
mention Bootp but the Atari version of NOS doesn't seem to support
it. Short of dialing up my account with a terminal program daily
to figure out the IP address how can I get past this?
So far, what happens is that I will choose connect with the Demon
menu and the modem seemingly connects. Then the program hangs.
I can only exit by using the ftp command (which doesn't work because
I don't think I am connected correctly).
Anyone have any suggestions? I have heard that Mintnet is even more
difficult to set up than NOS so I will try to avoid that. Anyone
that has gotten NOS to work with his/her university slip account
please help. It would be much appreciated. The tribulations I
have had have made me consider selling my Falcon and getting a
PC or Mac :-(.
Thanks for any help.

So what's the point? The -02-02 is working just fine in my 1040 STe and
I've been using mostly 1.44 disks now for almost a month. If it goes bad, THEN I'll
buy a AJAX chip.
What I meant was that those WITHOUT the -02-02 have a very little
chance of working reliabily.

3790. Syquest and TT, drive seems to be dying

Newsgroup: comp.sys.atari.st
Date: 1995-09-12 00:00:00 UTC
From: cl152@cleveland.Freenet.Edu
Message-ID: <433tsr$duj@usenet.INS.CWRU.Edu>
Source record: 159156

My Squest 270 removable is making a strange ticking noise and
the red light is coming on periodically. When the light comes on
it reacts as if a new cartridge had been loaded. This is my
second unit, the first one scrambled a disk just a few weeks
after I had purchased it. It's hooked up to a TT using the ICD
software. I am afraid it is on the same road as the first.
Any ideas, is the above normal, just bad luck?

Thanks

Yes, it does. I had some trouble getting it to work at first but
thanks to some replies to a post on c.s.a.s. it works fine.
The trick is that it has to be in a folder called CIVILIZA.TON
It works with Backward - I can find the settings if you need but
I think just allow 2Mb RAM, 16MHz speeds and it's OK.

Aidan.

3792. Truecolor-Off-Screens in NVDI?????

Newsgroup: comp.sys.atari.st

Source record: 159158

Hallo! (Hi: English at the bottom!)

Ich hab eine Frage zu den Off-Screen-Treibern in NVDI: Wie bringt man den seit neustem vorhandenen True-Color-Off-Screen-Treiber "OFF16MOV.NOD" zum laufen?? Alle anderen Off-Screen-Treiber funktionieren problemlos (bis 32768 Farben). Ich habs mit allen Kombinationen von Format (Interleaved, Normal, Packed Pixels) und Pixelreihenfolge (Normal, Falcon, Intel) versucht, aber nichts hat geklappt. Als Plane-Anzahl hatte ich jeweils 24 und als Farbanzahl 16777216L angegeben. Was mache ich falsch?

Ueber Antwort wuerde ich mich sehr freuen, am besten bitte ueber e-mail!

- Mani -

Hi, I'll try it also in English: Does anybody know the correct use of the new truecolor offscreen driver "OFF16MOV.NOD" in NVDI?
The others do work fine (up to 32768 colors), but i can't make the truecolor one work yet.
What are the correct work_in's?

Simon Williams (simon@bassland.anglianet.co.uk) wrote:
: Hello all. Could somebody help me out on these following problems I have
: with MintNet.

: 1. When inetd is run from rc.net; I get the message "/pipe/log
: not found". How can this be solved?

You need to run syslogd before you run inetd. I start mine from
mint.cnf. inetd wishes to log an event in the system log.

: 2. I have put a passwd file in /etc. But what is the proper syntax of
: each entry in this file? I.e. What do they mean?

The fields in order are:
username:password:user id:group id:description of user:\
home directory:login shell

: 3. If I try to ftp my machine from my other Atari, all I get is the
: message stated in question 1 (above), and the session closes.

I haven't yet tried ftp-ing back to my box - only out of it, but
your right - fixing point 1 will mean that inetd is running
and know what to do with the ftp request when it comes in.

: 4. When I use lynx, I can select 'D' to Download a picture. After the
: transfer has finished, I get the option to save to disk; except it
: doesn't! I notice the 'html00?' eppear in the /tmp directory, but no
: file saved with the filename I give! What needs putting into the
: 'lynx.cfg' file?

Can't help sorry.

: Sorry for a long list of not-so-perfectly-worded questions :) But any
: help would be much appreciated.
: IMO, I am very happy with Mint+MintNet+MiniXFS+Thing desktop, as I can
: still use the desktop, and have my Falcon connected to my local ISP,
: via 'modem1' and my ST via serial2!!. I am trying to stop using Nos
: altogether you see. The reason why I still use 'Nos', is because of
: its pop3 mail support as well as SMTP. BTW: This version has only
: just recently appeared on Demons ftp server.

Yes, MintNet is fantastic - its given my mega st a new lease of life.
I can happily work from home now.

: Thanks again, Simon.

Your welcome,

Donald

>On the computer he use Wordplus 4, which in fact is a version of That's Write.

Are you sure about this? I don't think WordPlus and That's Write have
anything to do with each other.

I'm sure that WurdPlus 4 supports SpeedoGDOS, and there's a Greek font
for that. You could try this. I haven't checked it for completeness,
though. It's called Symbol.

As an alternative, TeX can typeset Greek texts beautifully, but if
you've never heard of TeX, never mind.

Yes it does. However, colors are not correct: you have a pink sea!!!
You can use NVDI, it works much faster and with correct colors. Anyway,
if sometimes go wrong (2 bombs). Using Backward is OK, too, it works fine but so
slowly!!!

>|> > then that would have excluded my WORM drive ! ;-))))
>

I have _two_ monsters, here they come.

1)
Mega ST in BigTower, 4 MB ST + 8 MB TT RAM, HBS 640 28 MHz accelleratorcard,
ICD ADSCSI+ hostadapter, Quantum Trailblazer 850 MB, Syquest 44 MB removable,
Iomega ZIP-drive 100 MB, 14K4 dynalink modem, HD floppydrive, ET-4000 video-
card, MAG MX17S 17" trinitron monitor, TOS 2.06

This system was originally based on a Mega ST 1, it runs MagiC 2 / Neodesk 4

2)
Falcon 030, 4 MB, HS-40 accelleratorcard 40 MHz in custom case with PC keys.
Toshiba 420 MB 3,5" IDE internal, 15" SVGA monitor. -accompanied by-
Custom DriveTower with Apple CD-300 CDRom, Quantum Trailblazer 850 MB,
Syquest 44 MB removable, HD floppydrive, Iomega ZIP-drive 100 MB.
80 Watt speakersystem, Tabby graphic tablet.

This system is eagerly awaiting a "Speed Resolution Card" and 14 MB RAM...

Both systems built by me. Logitech mice in use.
A HP 500 deskjet is shared by both computers.

[snip...]
>Also I'm planning to raise the speed of the serial port to 56700baud and perhabs
>I'll add a second RS-232-Port.
>
>Bernd

Bernd, I am thinking about the same modifications myself; increasing the speed
of the motherboard itself and adding a second serial port.
Do you have any plans yet ? Maybe we should keep in contact about this...?

Greetings,
Maarten

That's right.

>Basically, this is mentioned in the big ads, too (available for 3
>operating systems), but nowhere you can find a hint that version 4
>is still under development :(!

It is. Since we had to redesign lots of things internally for portability and did that sort of things for the first time, we underestimated the necessary time rather strongly and have to excuse us for that at our customers. But I can assure you we have worked hard on it all the time. The upgrade will not just be cosmetic changes, but we redesinged fundamental things like using Unicode consequently (a 16-bit character set which, among user things, permits access to all ~560 characters in Speedo fonts and documents portable between platforms), supporting pair kerning, and we did lots of optimisations.

Papyrus 4 will go into beta testing in a few days, and then we'll still need about 2 weeks for new features (the english version may take a little longer). Of course ordered upgrades will be delivered as soon as they are available.

I have used BSS Debug on my Falcon to run some programs
as if they were running from an interperter. You can watch
program execution and the converted assembly real time. I have
only tried this with Scape881.prg so far, but as the routines
come up, I can watch the screen display at the same time. Kinda
of neat, but to make good use of this you'll have to be an
assembly programer.

I run CIVILIZATION on my Falcon030 without using Backward. With very little problem, too. The subject is covered intensely in the GEnie Atari Roundtable - just do not use the "INSTALL.PRG" when loading to harddisk - and make sure you have the disks with the Jul 12/94 date on them. Microprose will update your disks if you have an earlier date...

Send me e-mail at s.lyster@genie.geis.com if you want more information on how to run CIVILATION on a Falcon.

Simon Williams (simon@bassland.anglianet.co.uk) wrote:
: Thanks for the info regarding the /passwd file Billy.
: I'm actually still trying to find where I get ftp 'syslogd' from. :(

You should be able to find it in any of the ftp sites that have the
Mint/Network directory... or, as a second-best alternative, try
the MiNT-OS package. This is a package that includes an init shell
that gives you an even closer Unix-like envrionment. It also includes
syslogd, if I remember. You'll need to start syslogd from mint.cnf
and add/create /etc/syslogd.conf, to give it logging parameters.

Re-reading your original post, you asked about downing a D via lynx
to save to disk. The option works on my system, I've done it before.
Try out a couple of things: make sure that you have /tmp as environment
variables:

```
sln d:/tmp u:/tmp
setenv TEMP u:/tmp
setenv TMP u:/tmp
```

I may have the syntax for setenv wrong, but you get the idea. Also, whenever
working with Mint at such a low-level, work from drive U:. If you've got

```
sln d:/bin u:/bin
[ ... other symbolic links ... ]
cd u:/
```

Then you can just use /bin and so on, without regard to physcial devices.

Finally (!), make sure that lynx.cfg is in /usr/local/lib as lynx.cfg
and is at least chmod 444 (-r--r--r--)

: With regards to my serial ports:
: 'modem1' is the standard 25-pin male serial port
: 'serial2' is the 8-pin LAN port.

: I haven't done any mods....my Falcons never been opened....yet :)

: When you say "normally useless" port, I take it, you mean 'serial2' NOT
: 'modem1'???

Apperently there is enough elecronics for modem1 port. The Falcon's
only serial port is the 9-pin serial connecter, and that is configured
as modem2. Supposedly modem1 exists, but needs a modification to be
usable.

Anyone, correct me if I am wrong, I am working from an admittibly
terrible memory!

Posting this for a friend.....

Subject: padding a file

There are times when i make my own 'english menu' versions of a program.
No one taught me how to do that. I just started abusing programs until i
learned stuff like 'never change the length of the text segment' 'never
change the length of the file'.

i would like to learn how to break that second rule.
i would like to be able to recognize my translated versions by their file
size.

How do i (safely) add meaningless stuff to the end of a program so that
it still runs like before???

i have EDHAK3, and a lot of other tools, that will allow me to add stuff
to the end of a binary file, i mostly want to know:
is a 'space' character safer than a 'null' character?
should i add a 'Contol-Z' to the end of the file as the last character?

in short, what is the best character string to add???

I'm sure he'll appreciate any help you guys can give!!

Thanks,

Dan brown

Sven-
Can you accept credit cards from the States for Freedom 1.14E registered version. I know that the Brits are doing it, but they cannot accept US dollars and getting pound stirling checks here is extremely difficult and prohibitively expensive (relative to shareware fees.
For example, for me to get a postal money order in stirling I first go to my local postoffice and guess what the stirling amount is in US dollars. I give them the dollars. They give me a receipt which I am then to mail 1200 miles to St. Louis, Missouri. At St. Louis, the post office there figures what the dollars are worth in stirling (or Swedish krona, I suppose) and then they send this to the address in the UK or Europe. The chance of getting the amount right is small. And, of yes there are fees for this *service* as well.
I realize you didn't ask for all this, but at the worst, it may amuse you.
Best regards, -- Cliff

Is that the speed of an 040 Atari (if they exist) or Quadra, with
or with out Magic C installed?
I run Magic C Mac on a Quadra 630 at my day job, and it simply
flies. Then came the Power Mac's. Of course I had to go faster,
but have always been told that no version exist for them.
I guess they ment no "native" PPC version of Magic existed.
So,I upgraded to a Quadra 950 and added a DiiMOCache 50mhz 040
with 128k cache. It's not up and running yet, but it sounds like
it should out perform the Power Mac's. I should have some bench
marks in a week or so. If any one is interested I'll post them.

: HTML browser could easily be adapted to be a client!

It's called "tia" - the internet adapter. A version exists for a lot
of machines, but Atari isn't one of them. You need two peices: the
server running on a unix host, designed especially for that host
(ie: SunOS, HPUX, etc...) and the client running on the local machine,
again, designed especially for that machine.

Browse Yahoo for tia, I am sure you'll find info on it.

3833. Help wanted with OASIS/TT/NOS

Newsgroup: comp.sys.atari.st
Date: 1995-09-12 00:00:00 UTC
From: dave <dave@mbha.demon.co.uk>
Message-ID: <810918408snz@mbha.demon.co.uk>
Source record: 159243

Here's a problem...
I use OASIS (thanks Phil) on my TT. The startup.nos file specifies a bps rate of 38400. Demon can communicate at <= 28800. I use modem.cpx to send all comms traffic to modem 2, but the highest baud the cpx can configure to is 19200. Result - logins to demon run at 19200.

This doesn't present a problem with BBS dialups since CoNnect appears to over-ride the cpx configuration, but how to fix it so that OASIS does the same?

I am nudging the limits of my knowledge here, so any advice would be appreciated...

BTW, thanx to everyone who wrote about my last shriek for help (cannot run spectre). Didn't work but thanks for replying. I can't boot spectre from TOS or MagiC. I am sure it can work but I can't get my head around what I am doing wrong :-(. Are there any further thoughts that might help?

I suspect this to be the problem. Most musicians seem to prefer mono.
I highly recommend an SM 147, if you can afford it!

>if it i the monitor, does anyone need a color monitor in
> exchange for a monochrome?
If you are anywhere near Shawville, Que. (60 miles upriver from Ottawa)
I'll swap a mono for a colour. Otherwise shipping becomes a problem!

From: dwood@chat.carleton.ca
Message-ID: <DEsz2C.72A@cunews.carleton.ca>
Source record: 159248

Hi!
I have an Atari 1040, 1 meg RAM at home. I am an ignorant university student with as much computer experience as money; little to none. How do I go about getting online? I'm online at school now on their PC so I have some basic knowledge but I don't know how to go about finding stuff to do the same for my atari. Do I need a special modem? What programs do I need (if any) to start up. As soon as I can dial up somewhere I'm ok 'cause the server through my school is pretty user friendly but if anyone out there could email me with suggestions or help I'd appreciate it.
Thanks for your time,
Dave Wood.

My TT (bought in 1991) has a WD1772 labelled 02-02 and had a 720K drive
fitted as standard. I recently bought a 1.44 floppy drive and connected it to
the TT using the original ribbon cable. Everything worked fine, reading and
writing, I could only format from the desktop after I changed the setting of
DIP switch 7 in the front right of the PCB.
I have had no problems from using this drive after nearly four months
now.

One of the main problems for a ST is the graphics capability. A GIF viewer
uses tricks like screen swapping etc on a ST. So how to display text and
graphics at the same time like Mosiac does ? Multimedia type of Web viewer
will be difficult to implement on ST, but is possible on the falc.

Just my 2 cents worth.

OK - Here goes (grin). I have a <<Trisexual>> Mega 4 STF. It runs GEM with
a TEC card for TOS 2.06. It also has a 286 with math co-proc inside (the
AT-Speed) to run DOS _and_ has the Spectre dongle for Mac work. All threee
OS's boot and run off _one_ SCSI hard drive (120 meg) connected by an ICD
Link. There's also the floptical drive for backups and a migraph hand scanner
as well as an Epson (old) LQ800 printer and 14.4 Boca modem. Do I qualify! ;)

Ah :) Well I meant 'standard' as in 'commonly used for Falcons, etc.'.
From what I recall in asking around before it seems that most everyone's choice
was Archive brand, and apparently they manufacture the QIC150s. But the
QIC150 drives are fairly new then, technology-wise, with the DAT drives
being the top-of-the-line?

3849. Atari ST stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1995-09-13 00:00:00 UTC
From: phand@netcom.com
Message-ID: <phandDEtt1y.8zt@netcom.com>
Source record: 159109

I have for sale:

1 Atari 1040ST in fine working order
1 Color Monitor (SF whatever: one of the early ones; has received
almost no use, and works great)
2 BW Monitors (one in need of adjustment: flickers lots; other
works fine).
1 520 ST (the kind with the 1040 body), defunct since
I removed all the RAM (good for parts, though, or could be repaired).
Specter 128 with Mac ROMs
4MB SIMM RAM-upgrade daughtercard with installation instructions
(no RAM, tho).
1 Double-sided External floppy drive, with power supply, working fine.
TimeWorks Publisher Software
A boxload of programming manuals for the ST, which I'll probably trash.
About 100 Low Density diskettes, some with miscellaneous ST/Mac software.

All this can be yours for $200 plus SH.
Price is negotiable, but you must take it all.

If you want model numbers, I can get 'em; it's been a while
since I used these thing as I have a Linux PC and a NEXT now.

please email phand@netcom.com with any offers, questions, etc.

PAH

Actually, you might want to check out the offer from Computer Direct,
they're advertising a 1.44 drive kit for ST computers that includes everything
you need to make it work and a 1.44 meg drive for $1.49 CDN. Sounds like
the best option to me.

:
: My Squest 270 removable is making a strange ticking noise and

Yes I do have some ideas to put your mind at rest...
BTW I am on my 4th drive.

I have talked to Syquest in Singapore. The situation is this:
About 4 months ago the factory stopped producing the 270 because of a big problem with the drives. There were bad batches.
However, I am told by the distributor that the factory is now producing the new enhanced drives with the upgraded chips.

However, I have heard from german friends that an article in a german computer magazine on the 270 suggests that "many, but not all the problems are fixed in the new enhanced drive".

My personal experience is that the new enhanced drive can still give big problems.
I have taken delivery of the enhanced drive but had it crash the media within rouhly 15 minutes of operation.

The symptoms are many and varied and your symptoms are quite ordinary but fatal. It is not due to the setup of your computer AFAIK.
I have tried 3 different computers, different power supplies and cables and generally fiddled everthing I could.

I do know several people that use the drives extensively and do so without a problem.

I suggest you take the drive and all media back to point of sale and demand VERY loudly a full replacement!

Remember that Syquest Singapore knows of these problems and it is becoming a liability for them.

I hope other people can add to my story.

: necessary time rather strongly and have to excuse us for that at our
: customers. But I can assure you we have worked hard on it all the time.
: The upgrade will not just be cosmetic changes, but we redesinged
: fundamental things like using Unicode consequently (a 16-bit character set
: which, among user things, permits access to all ~560 characters in
: Speedo fonts and documents portable between platforms), supporting pair kerning,
: and we did lots of optimisations.

Hello, Christian!

I'd like to ask you, how the forthcoming versions will differ - or if they will at all? I mean, supposingly the MAC-version can import Mac text formats, OS/2 version PC text formats, etc - but will e.g. Atari-version handle all the same text and picture formats as the Mac- and PC-ones..? I REALLY wish it would =-) !!!

Another interesting subject: we've all seen how GIGANTIC and SLOW most modern PC- and Mac word processors have become. So, will Papyrus 4 PC- and Mac-versions be physically bigger than Atari-version (I'm just curious!), and will there be speed differences on comparable computer platforms between the versions?

Finally, the idea of 3 identic Papyrus versions is great, but -please- make certain that it won't lead to the situation where all developing work is done for one or two platforms, and the other version(s) come much later, maybe simplified - or in the worst case, not at all =-(! What happened to Page Stream, Timeworks DTP, and so many other multi-platform Atari programs, simply frightens me... I know the markets will push also you at R.O.M to this direction; the "big money" is in one place, maybe not so
much in another. But still, our needs are the same - from Atari-users (smallest) to PC-users (the "big bullies").

Thanks again for EXCELLENT program =-) !

Tommi (a 99.97% satisfied Papyrus Gold user)

Hi,

Kevan Winch (kevan@empyr.dircon.co.uk) wrote:

> How far has anyone gone in upgrading a plain vanilla Atari ST ?

> I would love to hear of some 'Monster STs' in existence !

Ok, here is mine!

I have an ATW 800 (Atari Transputer Workstation). Beside the Transputerboard there is an Mega-ST-like TOS board as IO-Host for the Workstation. I put a PAK3/50 MHz with 68030/68882 on it and the FRAK RastRAMCard with 4 MB.

Currently I am fiddling with a VOFA, an adaptor for ET4000 VGA Cards.

I have an Hard&Soft Vantage Hostadaptor, an Quantum ELS 85, Quantum Lightning 540S and a Quantum LPS 105. The latter is only for backups, so I have mostly unplugged the DC connecter.

I am looking at you ;) through an 15" Multiscan, but still in 640x400 Mono.

> Charles Hirst.

There is some uucp stuff around. If you only want to exchange Mail an News,
I recommend UPOINT, a GEM based mail an News exchanger.

If you have an TT and you like Unix, install Linux68k!
With that you have access to all the good stuff (taylor uucp, TCP/IP, SLIP)

If you don't have an TT, but you want Unix, take the KGMD (Knarf's German
MiNT Distribution). It contains all, incl. uucp, to run a 4 MB ST Unix-like.

Just take a look at the main Atari servers a.a.u.e, hensa, ...

No, not really. I suspect many of the drives used by Atarians are former Unix drives, which had been displaced by DAT. Mine is, anyway!

The Q150 drives are quite slow, but can get 250MB uncompressed (plus more with DB3 compression) per tape, which is reasonable for most Atari people.

3864. Re: INTERNET GRAPHIC BROWSER?

Newsgroup: comp.sys.atari.st
Date: 1995-09-13 00:00:00 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <hNFhdw6.ari2550@delphi.com>
Source record: 159124

I agree. The stock ST and STes won't be able to handle 90% of the
current WWW sites. Most of it is due to the fact that they're designed
for 640x480 mode. Traveling the WWW in 16 colors is bad enough but
to have the Browser dither every graphic to 4 colors would be too slow.

Also, you would need at least 4 megs of RAM to surf as I'm sure that
you want some or all of the pages you're viewing to be cached.

I definately think that the Falcon could browse the net fairly well but
I'm not sure that its 640x480x256 mode would give you good performance
w/o NVDI or Warp9. I've seen Mac LCIII's browse the net and things
seemed a little sluggish to me. Hell, even on my PowerMac 6100/66
at work and a T1 connection, things can crawl!

My two cents...

Ari

Why not run a terminal program in a DOS window? you could copy files between
the two machines, without blocking the PC.
or check out some of the Atari networks, see if they can interface with the PC.

Alain,
Thanks for your help. Which version of NVDI are you using. I
have version 2.5 and it keeps completly screwing up my monitor so I have
stopped using it. It also did horrible things to Geneva/Neodesk. Anyone
else have problems with NVDI 2.5 and the Falcon?
Regards
Dean

>
> Just my 2 cents worth.

...but HTML browser displays graphics and text on an ST! I'd think using a client-server thing would be much less memory hungry and a lot easier to set up than a MiNT + MiNTnet setup.

Stick to SCSI instead. You'll thank me for this advice, in time. ;)

Keep in mind that IDE drives *need* TOS 2.06 in order to autoboot,
else you have to start the driver from floppy everytime (this also means
ACC's, desktop.inf etc are loaded from floppy)
Besides, IDE drives only work reliably with short (< 40 cm overall)
cables which means you *have* to put the drive inside the computer,
not external.

The cards I know are all made in germany. No adresses known to me, alas.

On bede@newshost.li.net, cliff steward (bede@newshost.li.net) typed away:
: Sven-
: Can you accept credit cards from the States for Freedom 1.14E
: registered version. I know that the Brits are doing it, but they cannot
: accept US dollars and getting pound stirling checks here is extremely
: difficult and prohibitively expensive (relative to shareware fees.

I haven't seen this thread till today, but FWIW, here is my
contribution...

Joe Connor and I run Shareware support schemes in the UK.. Selectric,
previously handled by Joe, is now handled by me.. and Joe now has taken
up Freedom.

If you wish to register for any stuff from either joe's or my list,
then you only need to send one of us the total payment with details of
programs you wish to register.

I support some US and Canadian shareware, so you may send the money to
me via the people in those countries, saving you the hassle of buying
an international Money Order etc... when they get your payment, they
e-mail me, and I just send you the registration disks straight away.

If you would like to take advantage of this facility, then please
e-mail me for further details. Also, if registering from abroad please
add an extra pound to each program registration, to cover the extra
shipping I pay.

Coming soon via me.. the facility to pay me cheques in US Dollars, or
any currency for that matter...

Hmmm. A utility for atari computers yet to be written. Problem is,
it would only be suitable for the likes of the Falcon or an ST with
a PAK 32 board installed with say the MagiC multitasking software.

>
> What is ERGO?
>
> I have been using GFA Basic for nearly 8 years and am always interested
>in anything to get more out of it.

ergo!PRO is an Shell for GFABASIC. You can start RSC-Editor, Compiler, Linker,
and so on directly from here. The compiler-ortput is written to an GEM-Window.

But ergo! a A LOT OF FUNCTIONS more...

Crossreferenz-Analyzer, Profiler, Symbolic Variables, ergo! can write the
used Variables directly into an Procedure or function. ergo writes directly
the *.gfa-files. merging long LST-Files is past...

an example...

```
------------
PROCEDURE load_pathfile(a$,busy!,VAR arr$(),arr2$(),ndx&)
.| Glob. Var.: last_pathfile$,time&,dum&,z%,start$,a&
.| Felder : z$()
.| Ruft auf : defmouse,lock_screen,open_busy,update_busy,close_busy
.| unlock_screen
.| Aufruf in : exit_object_selected-1,user_do_on_open-1,
--------
```

Felder = Arrays
Ruft auf = calls up X
Aufruf in = would be called in X

ergo!PRO can MUCH MORE but it is too late for me to write more:

Ohh, i forgot. Christoph Schardt (Author of ergo!PRO) gave me an Mail which
i should post here.

Here it is:

Hi,

yes we are going to present an english ergo!pro-version. But at the moment
I can't tell you exactly, when it is published and who will be the

distributor. For more informations please mail to

: them. It would be nice if someone could do a project like this. I,
: unfortunately, lack the skills. TwinSock includes full sources, but I also
: know nothing about the way Windows handles winsock.dll stuff.

tia is commercial. There is a major difference between tia and slipknot.
Slipknot is an extremely simple (technically) program. You run a front-end
program that runs lynx on the unix (or whatever) host. Simple text is
rendered as normal, but graphics are downloaded and then display. Such
a front-end should be possible on the ST. We already have a browser, even
if it is only off-line. The front-end downloads the text and/or graphics,
and since the off-line browser can accept arguements on the command-line,
you simply do it that way...

tia, on the other hand, is more complex, in that you don't get a crappy
front end (slipknot just looks ulgy), but you can run any winsock compliant
browser, like Netscape.

I heard this a couple of times right now. I once wrote to Dave but got no reply.
Is this just rumours or will there really be a Mac emu for the Falcon (soon).

Also, I doubt if such an emulator will be cheaper than a used LCIII f.i., so
chances on the market would be pretty small.

Cheers,
Chris

Source record: 159055

Ever wanted to make you external modem, monitor stand and other peripherals match the rest of your ST system? Ever wanted to get rid of the weird brown hue you external ST drive takes on over time?. I've found that the best spray paint for the job is sold at Canadian tire as an auto touch-up spray. The colour is described as "dove gray". It apparently is for Dodge/ Chrysler products. You should start the job with a good primer. The gray primer (again sold in a spray by CTC) is the best since it is a close match to the dove gray final coat (less trouble covering the primer).

3895. WANTED: Source for FDI on Cubase Audio Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-09-14 00:00:00 UTC
From: ujwb@uxa.ecn.bgu.edu
Message-ID: <43997e$geq@ecom4.ecn.bgu.edu>
Source record: 159056

I am looking for a vendor who sells the FDI for the Cubase Audio Falcon system. Steinberg and Toad say they aren't made anymore, although given the discussion of it on the cubase groups, that is hard to believe. Looking for a vendor who hasn't sold them out.

> >Thanks in advance.

Under windows 95, just run Ghostlink - it doesn't block the PC and allows you to use the PC drives on your ST - works with networked drives & remote CD ROMs as well :)

(I use it all the time at work - my f030 is easier to use for development work than my PC)

Craig.

3897. connecting 2 STs through printerport

Newsgroup: comp.sys.atari.st
Date: 1995-09-14 00:00:00 UTC
From: mho@ceres.fokus.gmd.de
Message-ID: <439dk3$mda@stern.fokus.gmd.de>
Source record: 159058

im looking for software to connect 2 STs through the parallel port,
enabling the access of the remote drives just like with the various
midi-network packages.

i cant use the midi and serial ports because i am planning to do the
exchanges while running cubase with the serial as an extra midi out.

any hints to existing software or some well documented c-sources of an
existing midi net where i could write a parallelport driver would be
appreciated.

3898. Booting from floppy on MegaSTe

Newsgroup: comp.sys.atari.st
Date: 1995-09-14 00:00:00 UTC
From: rhett@bigwpi.WPI.EDU
Message-ID: <439j52$k1t@bigboote.WPI.EDU>
Source record: 159059

i was reading in my owners manual and it gave instructions for booting
from floppy that dont work (Mega STe 4 meg, hard drive).
it says hold ALT down after the power light comes on and release it
when the busy light for the drive comes up and the com,puter should
boot from floppy..

after this didnt work i
played around and found that holding ALT, powering up, letting go when
the busy light turned off, then pressing CON-ALT-RET caused the
computer to boot from floppy.
the reason i am doing this is to get some older commercial games to
boot since they wont run when selected from the desktop (they want to
autoboot).
Well, some worked and some didnt.
Starglider II autoboots without
touching anything, works fine (great game).
Populous loads the title screen, lets you select conquest, and then
freezes with the key combo.
falcon loads title screen, asks for disk 2, and freezes.
wizball loaded fine with the CON-ALT-RET trick.
defender of the crown loaded upto the second disk and then bombed
(again with key combo trick)

what exactly am i doing by pressing the keys that i press?
is there a better way to do it?

from what i hear Falcon should work just fine. Why wont it?

any help would be much appreciated as i want to play the old games
that i still like. call me anachronistic.

If it is anything like the system I used to use, just get it FTP'ing then hit
'CTRL-Z' to suspend it, then type 'bg' to restart it in the background.
If you have hashmark printing turned on though, this will still appear on your
console, as will any status/error messages from the FTP server.

3901. Development Tools FREE (Almost!)

Newsgroup: comp.sys.atari.st
Date: 1995-09-14 00:00:00 UTC
From: Larry Carter <LarryX_Carter@ccm.jf.intel.com>
Message-ID: <43a0da$2ff@news.jf.intel.com>
Source record: 159062

Despite my recent resurgance into the Atari world, I have found I just do not have the time to spend on my Atari. Therefore, I am giving my 520STfm to a single parent who can't afford a computer (she's got a young son). However, I do have some nice development stuff that might interest some of you. Since she would not need nor use these kind of things, I thought I might pass the opportunity on to you all. So, here it is:

Prospero Pascal w/bindings - This is a VERY NICE Pascal package with complete TOS/GEM/AES bindings (very close to C bindings, the manual does a good job of explaining differences). True Pascal fans will love this package (I sure did!)

HiSoft Forth - This is a good Forth kernel package. I started to get into it, but Forth is just a bit to weird for me.

GFA Basic 3 Compiler - This is the compiler only for GFAB3 (old I know). It was mailed to me by mistake, and I never bothered to send it back.

GST C Compiler - This one really sucks, but I never cared because I just couldn't stand C. It works though, as far as I know anyway.

GST Macro Assembler - Uh? Assembly? Dropped this crap like a hot potato. I hated Assembly even on easy processors (i.e. Would rather grate my skin off and poor salt on it than program in Assembly). But I'm sure someone would be interested as it is (was?) supposed to be a really good package.

Also have some really awesome ST books:

Computes! ST Programmers reference guide TOS
Computes! ST Programmers reference guide AES
Abacus ST disk drives Inside and Out
Abacus C to Basic
Some other books that I can't remember what they are titled (mostly Abacus) and are not terribly great anyway but.....

PRICE? Well, you pay for shipping and there yours!!!!! :)
However, if anyone wants to through a Jag my way..... ;)

I would rather send this stuff to someone who does not have any development tools and would like some (i.e. Beginner?) or maybe a users group. Basically, anyone who would actually use it for themselves and not turn around and try and sell it, which would really piss me off. I have no clue what it would cost to ship

so that will just have to be worked out later.

Anyone who is interested please mail me.

Larry Carter

Yes, this would be the TeX typesetting system invented by Donald Knuth.
k> I wonder whether you can give me (and him) an advice where to find
k> that particular or any comparable wordprocessor. URLs very welcome,
k> perhaps some friendly soul could also point out where to find FAQs
k> about compression- and archivers on the Atari.

There are at least a couple of PD versions of TeX for the Atari. One by Lindner and the other by Strunk. I wouldn't like to say which to go for as I have only used the Lindner version. You must understand that TeX is NOT a conventional word processor by a high quality typesetting system for the production of professional looking manuscripts. The text input is prepared on any old text editor and contains embedded commands which control style and layout. It comes with a subsidiary program called METAFONT which constructs bit-mapped fonts to match those required by the document. You would obviously need a good printer to do justice to the output (24-pin upwards).

I am only guessing but think that the spec. of TeX may be too advanced for the type of documents you are thinking of. Unless you want to have good overall control of the style and layout of a document you would probably be better off with a conventional WYSIWYG WP. If font variety is important you need something like Calamus, Papyrus, Calligrapher - if you will be satisfied with those fonts provided by the printer then Protext, First Word etc.

Not very beautiful, OK. But *not* too slow. HTML_093 is faster with the
display option 'monochrome(*)' than it is with 'greyscale' IIRC.
And greyscale looks very neat too, when you need color you'll have to
put up with the longer loading, but as long as one has the choice you
won't hear complaints from me.
(*) in both cases running on a 256 color videocard.

>Also, you would need at least 4 megs of RAM to surf as I'm sure that
>you want some or all of the pages you're viewing to be cached.

Almost all newer software needs more than one Meg. Let's just upgrade
the RAM and consider ourselves lucky we don't have PC's where the absolute
minimum for an acceptable system running Windows is 8 MB.
Also, quite essential things as NVDI, MagiC and Thing or Neodesk also need
more RAM than one as they are running parallel to applications.
Upgrading your RAM is money truely very well spent. As is a harddisk.
The minute you have more RAM or a harddisk you wonder how in hell you ever
did manage without it, everyone who experienced it can corroborate this.

>I definately think that the Falcon could browse the net fairly well but

Source record: 159077

Thanks for all the answers I got.
I put check_fonts = 0 as the last line in NVDI.INF, but it still checks fonts, still finds them damaged! these fonts work fine in coreldraw, and the adobe versions work fine with speedo5.
someone asked if it happened to all fonts, and yes, as far as I can tell it does. I've copied 50 fonts at random from the cd-rom, verified that they were the same size and date as the cd-rom ones, and NVDI reports them as damaged.
No one has been able to tell me what header NVDI expects. If I had even one ttf font that worked, I could check that header and copy it to other ttf fonts. Would someone who has a working ttf font check its (using memfile, or whatever) header and let me know what I have to put in?
thanks for any help.

Yes, there are several IDE interfaces for the ST/STF/M available where
you are supposed to install an IDE drive inside the machine.
I was hoping it would work with an STe as well (as I have) and got
hold of a circuit board/parts for it. I found out that it only
works with ST/F/M machines :-(
Anyway I still have the circuit board and pre-programmed chip
etc. and if you or anyone else is interested I'd be willing to sell it.
Email me for more info.
I also have addresses to some German producers of IDE drive interfaces.

Help I need a program for the atari 1040 to send and receive programs.
With my portfolio connected via a serial interface to the modem/rs232
port i send programs, which I want to receive in my atari.
But which program can I use for the atari 1040 to do that.

Help
please email to: geheniau@solair1.inter.NL.net

Thanks Job

Sounds like the patched ROMs are setting the wrong step rate.

If you are interested in using the patched ROMs, you could check the
step rate with TOS 3.05 installed, eg. using Profile, or peeking at
the word at location 0440 hex. Do the same with the patched ROMs, if the
value is different, then poke the original value.

Welll, it looks like you'll be looking forever for that one, Callum.
The author of FzDTerm, Aaron Hopkins, no longer supports the program.
If you want a good terminal program, use STalker from Gribnif Software.

Sadly it never appeared. ST Format got people to write to Lucasfilm to convince
them ans someone even had a quick go at stsrting the conversion themselves,
found it to be OK and even offered to do it for virtually free but Lucasfilm
simply said something about not being able to licence to 3rd parties! Sheesh
some people...

This is not possible because the ST's parallel port is "not truly bidirectional"
(to quote somebody or other). However this _should_ be _possible_ on the Falcon.

Your only (AFAIK) option would be to somehow use the cartridge port. Several
companies do a networking system based around the cart port.
But I have fried my cart port... so I cannot try it!

Hi Tommi,
Since the OS/2 anc MacOS versions are still going to take some
month, that's not yet decided. We are trying to find someone who
can license converters from the common text formats into RTF to us.
It depends on how portable they are.
Of course there will be some differences when Papyrus features depend
on special OS features, i.e. DDE (dynamic data exchange) and multithreading
in OS/2.

> Another interesting subject: we've all seen how GIGANTIC and SLOW most
> modern PC- and Mac word processors have become. So, will Papyrus 4 PC-
> and Mac-versions be physically bigger than Atari-version (I'm just curious!)
> and will there be speed differences on comparable computer platforms
> between the versions?

Programs are only as fast as they have to be. Much of the "fatware"
in the IBM-compatible world exists because users are told that
they need faster machines, and believe it, instead of insisting
on more efficient software.
The OS/2 and MacOS versions of Papyrus will be slightly bigger, since the
compilers don't produce quite as good code as those we have
on Atari. On the same hardware, they would also be a little slower,
and there is no OS I am aware of that is as efficient as MagiC or even
newer versions of TOS (except perhaps Acorn's RiscOS). OTOH that is more
than compensated by the average PC/Mac hardware which is much faster.
But since we, as Atari developers, have gone through the school of writing
software that runs acceptably on 1 Meg 68000 systems, we'll continue
to produce powerful software with low hardware requirements.
One of the things we'll avoid is using huge class libraries.

> Finally, the idea of 3 identic Papyrus versions is great, but -please-
> make certain that it won't lead to the situation where all developing

> much later, maybe simplified - or in the worst case, not at all =-(!
> What happened to Page Stream, Timeworks DTP, and so many other
> multi-platform Atari programs, simply frightens me...

That was at a time when ST's were still young, and Atari OSs were
undergoing a quick development which made adaptions of the applications
necessary. Besides, I'm not sure if these companies did as we do,
keeping most of the code in a portable kernel and writing libraries
that translate calls to the individual OS.
I don't think the Atari system software will change much
in the future now, so only few Atari specific things will need updating.
And even if they do, Papyrus 4 uses the EnhancedGEM library for which
the source is freely available and which is supported by the author
Christian Grunenberg.

> I know the markets will push also you at R.O.M to this direction;
> the "big money" is in one place, maybe not so
> much in another. But still, our needs are the same - from Atari-users
> (smallest) to PC-users (the "big bullies").

Well, the income has to do with the market size times the
market share one has. In that respect the Atari market is
still more interesting for us than you may think.

>thanks for any help

I believe I had and still have the Segate one... (well, the number is familiar). I believe that I am using it as the HD where BSDi is located. Other harddrives are used for user accounts, C Developments, and X-Windows, etc... though. It is pretty reliable, except on BSDi, I seem to be unable to softboot and comeback. I alwayse have to physically shut the system down to reboot. That is a pain.

You may be getting interference from your monitor if the monitor
is on top of the TT case!!

[drive problems deleted]

FLOPPY DISK DRIVES
The standard signals are as follows:-

Connectors:
34 way connector on floppy drive (5.25 card edge - 3.5 pin header)
```
.___.
Ground 0v 1| |2 Reserved (High Density Detected on some HD drives)
Ground 0v 3| |4 In Use/Head Load/Open
|---| keyslot only on 5.25 disks
Ground 0v 5| |6 Drive Select 3
Ground 0v 7| |8 Index Pulse Sensor
Ground 0v 9| |10 Drive Select 0
Ground 0v 11| |12 Drive Select 1
Ground 0v 13| |14 Drive Select 2
Ground 0v 15| |16 Motor ON
Ground 0v 17| |18 Direction IN Select
Ground 0v 19| |20 Step Pulse
Ground 0v 21| |22 Write Data Pulses
Ground 0v 23| |24 Write Gate
Ground 0v 25| |26 Track 00 Sensor
Ground 0v 27| |28 Write Protect Sensor
Ground 0v 29| |30 Read Data Pulses
Ground 0v 31| |32 Side ONE Select
Ground 0v 33| |34 Drive Ready
---
```

All signals are active LOW ie the signal is normally high (for example to
switch the Motor ON signal active, pin 16 should be connected to 0 volts).
So be careful plugging in the cables.

Male Power connector on drive
3.5 5.25
---.
|o / o | pin 1 +12 volts DC (may not be required by disk drive)
|o | o | pin 2 0v
|o | o | pin 3 0v
|o \ o | pin 4 +5 volts DC

Pin 2 is the HD detected signal sent from the drive to the TT.
Unfortunatly the 14 pin external connector does not have this signal
availiable, so HD drives can only be used internally on the 34 way
ribbon cable without a mod to the 14 pin connector.

hope this helps
dennis

I thought that TIA (The Internet Anywhere?) was commercial... Anyway, there are a number of other ones that emulate slip connections. I've used TwinSock on the the PC, and I've heard of slipknot and term, but I'm not familiar with them. It would be nice if someone could do a project like this. I, unfortunately, lack the skills. TwinSock includes full sources, but I also know nothing about the way Windows handles winsock.dll stuff.

I.>
Stef,
There is PD utility called Ghostlink which I think allows the ST
to access the PC but a later version is meant to work the other way as
well. I'm not sure if this version has been written yet or how well the
current version works.
Regards
Dean

3942. v08INF8: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1995-09-15 00:00:00 UTC
From: avg@cwi.nl
Message-ID: <DEy2DL.9ru@cwi.nl>
Source record: 159002
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 8, Info 8

This article is posted twice a month. It gives a short
introduction to comp.sources.atari.st and describes how to submit
sources or digressions to the group.

I am always looking for suggestions on how to improve the usefulness of
the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.sources.atari.st

The moderated usenet group comp.sources.atari.st contains publications
or announcements of sources and texts about programming for Atari TOS
computers. The publications on comp.sources.atari.st may be freely
distributed as long as modifications are documented and the original
authors are mentioned.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the
instructions below for submitting material intended for publication on
comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent
to avg@cwi.nl. If you are on a UUCP-only site, you can send them to
uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your
submission, or in a cover note. I try to verify that a program works,
and if I can't get it to work, I may hold up posting it for a couple of
days. Please note that, except in rare cases, software without
documentation will not be published. The backlog from receipt to posting
varies from one to four weeks depending mostly on the set of submissions
currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a

while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "sources". The source postings are also called "Issues". For a while, 'announcements' were also accepted, but there is now a dedicated group, comp.sys.atari.announce, for that purpose. The type of a posting can be distinguished by the subject line:

Subject: v02INF1: Introduction to comp.sources.atari.st

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

Subject: v06i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler

OSS - OSS Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
zoo-high - program is archived (Zoo 2.1 required to unpack)
lharc - program is archived (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 6, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

HOW TO OBTAIN OLD ISSUES

There is currently no officially documented archive for this group.

>for it and under what name would I find it? Thanks in advance.

Eric Smith is MiNT's author, so any MiNT kernel falls into that group
really. If you meam you want an unpatched (eg unfixed) version as
released by Eric, try MiNT 1.12, though I'd recommend 1.12h2 (I think
that's the most stable of the recent releases - anyone care to correct
me?)

Source record: 159006

I've noticed a few mentions of the Baracuda-040, though nothing that has given me any real information. I believe it to be an 040 accelerator for the Falcon. So my questions are:
Is this available, and if so at what price?
Does it dramatically improve Falcon performance?
Does it have softare incompatibility, I use Cubase Audio, and this is a must for me to be able to use?
Thanks for any any info, mail me or reply here, whichever.

Richard.

> can't get your sourcecode back?
>
>>>>
No different than the day your Hard Drive crashes and you forgot
to back it up for the last 2 weeks.
BTW, the Failure Analyis Lab where I work deterimined long ago
that when chip pins are 'Lifted' (bent up) that the failure with these parts is
normally caused by the bending, causing a small crack in the case. Over
time, 1 month - a year, this crack allows contamination into the chip to
cause the failure.
The decision to use the WD1772-02-02 is up to the person
paying for the update. $35 to $60 for a 1.44 FD and $2 for chips or another
$40 plus shippping - - - - it's up to them. Another thing, as long as the
Floppy is not being acessed or doesn't have a 1.44 diskette installed, the
signal to the 1772 is 8 MHz. It is only switched to the 16 MHz signal
when there is a 1.44 Diskette installed AND D0SEL is active.

Don't know of any 'Single Ended' to Diffferential adaptors available
but I know they do make them. But why? Single Ended is good for 6 Meters
but the slow down is quite noticeable. Of course, Differential is good to - -
ah, it's about 80 feet, don't remember what that is in Meters. Here again,
unless you are running 'Fast SCSI', quite a slow down. Also, you need
VERY GOOD Shielded cables, NOT the ordinary flat cables.
I checked my Spec.: It's 25 Meters.
The ST, TT and FALCON do not have 'Fast SCSI', that means
that the 'Handshaking' is always in 'Interlocked Mode'.

From: sidewind@crl.com
Message-ID: <43bb3u$4fc@crl.crl.com>
Source record: 159019

anyone have a RAM expansion card for my 1040/520ST to take it up to 1.5
or 2.5 MEGS?

just wonderin if anyone has any for sale ive heard of Frontier ect
either a populated or bare is fine

also anyone selling a monitor switcher available for from color/mono? :)

> thanks.merci

AFAIK you cannot use differential SCSI drives on the ST, nobody has
produced a host adapter that can handle them.

However, I have seen advertisements for boxes which convert from normal
SCSI to differential SCSI & these do allow long cable runs.

The suppliers usually advertise in magazines like EDN or Electronic Design.
I will have a look in the next copy I get. Be warned, these things cost a
few hundred dollars each.

> Where?

1) MiNTnet, from all good Atari archives. Turns your ST into a unix host (and turns you into a unix sysadmin :^/). Not recommended for <2MB; OTOH if you have 4MB you can go hog crazy and install X11 (mono only) while you're at it, from the TAF distribution.

2) KA9Q/NOS is the Poor Man's Internet; origially developed by ham radio freaks, it has been running on home computers since the world began (i.e. since around the time the ST was launched). Will probably run in 1MB (haven't tried it myself). Available in easy-to-install form at ftp.demon.co.uk.

>
AFAIK the LAN port has the same hardware (or can be modified to be the
same) as an Appletalk port. But nobody has ever produced software to
support a connection to an Apple. You would need this on the MSTE4.

Maybe you could try & get some of the serial port software for the ST
(allows two ST's to connect via serial cables) & run this on the MSTE4 &
the Powermac.
You would need a special cable.

Or, how about trying to get a SLIP connection going on both the MSTE4 &
the Powermac.

Funny, because that's just what tia does.

I haven't seen a tia port for the ST, but it shouldn't be hard to do, particularly for MiNTnet. To Tommy Kuei-che Hwang: keep searching those archives, something's bound to show up.

For GFA, you need version 3.6 and a patch program by Uli Ramps (mail
me, if you need it). It will then run in single mode/monochrome.

From: Stuart.Lyster@miratel.uniserve.com
Message-ID: <994_9509151518@miratel.uniserve.com>
Source record: 159029

I was wondering if someone could give me a short description of how to load differing fonts into NVDI that I just purchased. I always seem to end up with an ASSIGN.SYS file with nothing in it but

01p System.SYS
02p System.SYS

et. I don't think I am setting the paths properly... and I don't know how to hook up the SpeedoGDOS fonts either. Do I disable the DRIVER.ACC?

Questions questions. I'm afraid I am finding the doc's to be a little skimpy (and in German! most of the doc's on disk are in Deutsch!).

Please respond to s.lyster@genie.geis.com - Thanks!

(sorry, can't help with Cubase problem, as I am not a musician)

The ST series followed a reasonably simple naming convention (with some deviancy from them at times).

Of all ST models, the letters following "ST" tells whether you have an RF modulator (to use a household TV) and/or a built in Floppy drive.

M = Modulator
F = Floppy drive

The STE model is essentially a STFME, with the 'E' meaning Enhanced.

So, a 1040STF has a built-in Floppy, whilst a 1040STFM has both floppy and modulator built in.

An STM model (modulator Included) only ever came in the 520ST "body".

The Mega ST was a STF in content, but was in a "Pizza box with keyboard attached" body. The Mega STE was a STFE in content and was marketed as a "cheaper alternative to the TT" in an ST-coloured TT case.

The memory in your STFM can be expanded.

The memory controller in the computer can cope with one or two banks of chips, being either 512k or 2Megs. Therefore, permissible values are 512k, 1 Meg (512k + 512k), 2 Megs, 2.5 Megs (2M + 512k) and 4Megs.

In your case, the 1040STFM would need one or both of the banks of chips removing and 2Mbytes of RAM to replace it (16 1Mbit [128kByte] DRAMs). Removing one and replacing the chips would give you 2.5 Mbytes. Doing

likewise to the other would give you four megs. If you want to go further, third party expansion options allow you to go to (I believe) eight megs.

If you opt for a third-party expansion option, you may be able to use SIMMs, but these vary in design, so I can not go into detail with any certainty.

Only the STE models used SIMMs as "native" memory, as opposed to RAM chips on the motherboard for earlier ST models. (although I do recall that they might have been able to use SIPPs)

3971. Toad Computers announces mirror of UMICH FTP site

Source record: 159031

TOAD COMPUTERS ANNOUNCES MIRROR OF UMICH FTP SITE SEPTEMBER 12 1995

SEVERNA PARK, MD, USA--Sept. 12 1995--Toad Computers, a supplier of Atari hardware and software, today announced that they will make available a mirror of the University of Michigan Atari Software Archive. The University of Michigan Atari Software Archive has been the primary FTP site for Atari eight-bit and ST public-domain software for years. However, due to its popularity, it has often been very difficult to get into the site. Various mirrors of the "umich" Atari site exist (wuarchive.wustl.edu), b ut these are sometimes just as difficult to reach.

Toad Computers this week announces that they will maintain a mirror of the "umich" archive at their ftp site, "ftp.toad.net". Toad spokesperson David Troy explains, "We are very excited to be able to offer Atari users something extra; something that goes beyond just our homepage." Since November 1994, Toad Computers has offered a World-Wide-Web homepage which provides news, prices, product information and online ordering to Atari users. Since August 10, 1995, Toad Computers has been connected to the Internet through a high-speed/high-capacity T1 line (1.54MBps).

The Toad Computers "umich" mirror can be reached by ftp at the following address:

ftp://ftp.toad.net/pub/umich/

The Toad "umich" mirror archive is updated daily and contains over 700MB of compressed public domain software for the Atari 8-Bit, ST, STE, TT030 and Falcon computers. It is accessible from anywhere in the world through the Internet and such online services as GEnie, Delphi, CompuServe, America Online, and the Microsoft Network.

Toad Computers is a reseller of hardware and software to Atari users and also provides Internet services in the Annapolis, Maryland area. The company is one of the largest Atari resellers in the world and ships worldwide. Toad Computers is located at 570 Ritchie Highway, Severna Park, Maryland, 21146; 410/544-6943.

EMAIL: info@toad.net
ORDERS: 800-448-8623
FAX: 410-544-1329
INFO: 410-544-6943
WEB: http://www.toad.net/
FTP: ftp://ftp.toad.net/

Toad Computers offers the "umich" mirror as free public-domain and shareware software, makes no warranty as to its suitability for any application and

assumes no liability for its content.

NOTE: The "at" symbol in Internet addresses does not
always translate correctly; there is an at sign
in info"at sign"toad.net

I would imagine anyone who wants the most powerful and reliable operating system on the Atari platform would care what happens to MagiC. Sure, MultiTos and Mint setups would appear to offer more facilities, but they are so inefficient compared to MagiC. If problems have been found, I would much rather wait for a product than pay 100 pounds (or whatever) for a buggy one and then moan about how long it takes for bug fixes to be released!

Cheers,

Richard.

Two questions for all wizards out there :-)

1) What is wrong when my MEGA STE won't boot in 16 MHz
As soon as i try to switch from 8 to 16 it lock up - completely
Is there any special chip I could try to change ?

2) Lightning hit my modem and blowed it away :-(
At the same time the RS-232 port (the ST compatible one)
stopped working. When exacly the same thing happened to
my old STE there were to small ICs that needed replacement.
Does anyone now the number (ICx) and location of these in
a MEGA STE (I think everything else survived this time too)

[snip]

Is MiNTnet really that much better than NOS? I use NOS and find it very good but
I have all the Mint stuff on CD-Is it really worth the hastle of setting it
up???

> just grandad. Has anyone out there got it to run?

I remember running it successfully on my former computer, a MEGA/STe (4Mb, TOS 2.06). Only from floppy, though. I tried Grandad 1 as well, but that version didn't seem to like my computer at all.

I still dream about being able to continue playing G2 on my current Falcon. I've tried everything, but without success...

Wonderful game though.

Best regards

> The chance of getting the amount right is small. And, of yes there are
> fees for this *service* as well. I realize you didn't ask for all this,
> but at the worst, it may amuse you.

I'm stunned! This is yet another good example of how manipulated we all are by the bankers. I consider bankers to be amongst the worst thieves in our society!

Europe is supposed to become easier to live and trade in thanks to the European Union, but we still experience the same hassle whenever sending money abroad.

It's a mad world...

[Meanwhile, back in Atari world...]

Please feel free to send me 25 American dollars in cash notes (in a envelope inside another envelope), and I'll give you the latest version of Freedom plus, of course, the registration key.

I know this method sounds risky, but it may assure you to know that I've sent money this way across the globe for almost two years now, and with a 100% success rate!

Serving American users was not exactly what I had in mind when I started supporting Atari shareware authors, but what the heck...

Anyway, you're welcome. My addresses can be found below.

Best regards

Hello, I read your message stating that your selling an Atari ST. I have one myself, so unfortunatly I really don't need to buy it, however, I was wondering if you could help me with something! I have Starglider II for the ST, and remember there being a cheat code that you could type in to get unlimited ammo. Do you know what this code was, or have any ideas how to find it? Thanks! By the way, I might be interested in buying your Hard Drive for the ST if your willing to sell it alone. Let me know.

: to none. How do I go about getting online? I'm online at school now
: on their PC so I have some basic knowledge but I don't know how to go
: about finding stuff to do the same for my atari.

Send an email to Dave Troy @ Toad Computers < toad@charm.net > and ask
for his printed catalog of Atari stuff.

: Do I need a special modem?

Nope. Any "Hayes-compatible" modem will do. A good speed is 14.4.
If you're on a budget, forget the 28.8. Most of the connect-related
grousing on-line is "how come my 28.8 won't go 28.8". It's probably
due to the quality of the phone line....

Figure the modem will cost about $100.00. Add another $10.00 for
the DB-25 to DB-9/25 cable to connect to your ST.

: What programs do I need (if any) to start up.

The two commercial programs that spring to mind are STalker 3 and
Flash II. STalker has a heavy-duty c-language-like macro capability,
and Flash can display *.GIF images. Either will cost less than
$40.00, and will meet your needs nicely.

Hopefully, you'll hear from the shareware authors that have created
some good terminal software, too. (I'd like to know about them,
myself <hint> <hint>! :-)

: As soon as I
: can dial up somewhere I'm ok 'cause the server through my school is
: pretty user friendly but if anyone out there could email me with
: suggestions or help I'd appreciate it.

You're all set, provided your school does offer dial-up access.

Have fun!

Julian Gifford (julian@connexus.apana.org.au) wrote:
: Will this modem do 14400 or only 9600?
: If it will do 14400, what is the command to set that speed?
: Thanks,
: Julian.

G'day Julian, I use a Maestro E144FM this is a 14400 data/fax modem it's has a V.32bis/V.17 rating (although I don't know what all that means !!) BUT I can tell you that it runs at 14400, that is ASCII files transfer at upto 2700CPS and binary files at around 1680CPS when downloading via 'z modem'

I set the baud rate to 57600 (port 2 on my MSTe) in my comms prg (STarCall 2.0I) and get the following response when I logon to my server
PROTOCOL: LAP-M
CONNECT 57600

However reading the modem manual it states the following;
model
96 :Max data/fax rate 9,600BPS (V.32/V29)
144 :Max data/fax rate 14,400BPS (V.32bis/V.17)
FM :Fax/Data modem
M :Data only modem
So I would say that if your modem is ONLY V32 and not V32bis you may only have a 9600 modem.... this is of coures IMHO as I am NO expert on comms

Hope this is of help, regards

Source record: 159095

I use a Wangtek 6200HS (not too sure about the HS bit) DAT drive. A 90-minute DAT holds 2 GB; with Diamond Back 3 I seem to get a recording speed of not quite 1 GB per hour. One day I'll compile Erling Henager's SCSI drivers and I'll be able to back up my Minix partitions too.

No, it doesn't play DAT audio tapes. There was only one drive which did that and they don't make them any more. If it comes to that I don't use my CD-ROM drive for audio either -- something about the sound quality and my Quad pre-amp threatening to leave me.

Ever wanted to make you external modem, monitor stand and other peripherals match the rest of your ST system? Ever wanted to get rid of the weird brown hue you external ST drive takes on over time?. I've found that the best spray paint for the job is sold at Canadian tire as an auto touch-up spray. The colour is described as "dove gray". It apparently is for Ford products. You should start the job with a good primer. The gray primer (again sold in a spray by CTC) is the best since it is a close match to the dove gray final coat (less trouble covering the primer).

with your WD 1772-02-02 and now (because the WD was out of order) you
can't get your sourcecode back?
>

I will agree that pushing an 8 Mhz chip up to 16 Mhz is going to make it
fail before it's time, but it still might give years of service.

How about arranging the circuit so that it drives the WD 1772-02-02 at 16 Mhz
ONLY when there is a HD disk in the drive & the MOTOR ON line is active.

If this works (and I only thought about it as I read this post),the WD
1772-02-02 would only get switched to 16 Mhz when it needs to read/write a
1.44 Meg floppy. As it would spend most of it's time @ 8 Mhz, it should
have a long life.

3999. v23INF5: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1995-09-15 00:00:00 UTC
From: avg@cwi.nl
Message-ID: <DEy2Cx.9qy@cwi.nl>
Source record: 159101
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 23, Info 5

This article is posted twice a month. It gives a short introduction to comp.binaries.atari.st and describes how to submit binaries to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.binaries.atari.st

The moderated usenet group comp.binaries.atari.st contains publications or announcements of binary packages for Atari TOS computers. The publications on comp.binaries.atari.st may be freely distributed as long as no modifications are made to the packages. The packages may contain public domain software, shareware or demos of commercial programs.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.binaries.atari.st.

SUBMITTING BINARIES FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg. Note that comp.binaries.atari.st is not the correct place to ask general questions or to ask, "Does anyone have software that does X?" Post such requests to comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

If possible, submit your binaries in a Zoo 2.1 archive. I will generally check that everything in the archive is OK and that the files in the archive make sense on an ordinary Atari ST system (i.e. they are MS-DOS style files), unless the archive is specifically intended for use with an alternative file system such as Minixfs. If necessary, I will re-pack the binaries using Zoo 2.1.

If you are submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. But feel free to post demo versions. Submissions which I feel are of an excessively commercial nature will not be posted.

THE STRUCTURE OF COMP.BINARIES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "binaries". The binary postings are also called "Issues". The postings of type 'announcement' (history has only known 1) are no more supported, as we now have a group comp.sys.atari.announce for those. The type of a posting can be distinguished by the subject line:

Subject: v06INF1: Introduction to comp.binaries.atari.st

This first word in the title identifies this as the first info posting of volume six. Similarly, the subject line shown below:

Subject: v20i081 (binary): deadwrtr -- Ouija-word processor part01/01

identifies this as the 81st issue in Volume 20, and it's a binary posting. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v20i041 (binary): pet -- CBM PET emulator part04/39

The "References:" line, if present, points to the previous part of a multi- part program, so that newsreaders (trn, tin, nn, etc.) which can

follow threads will recognize a large program as a single thread.

The first few lines of an article's body are auxiliary headers that look like this:

```
Submitted-by: jackt@atari.com (Jack Tramiel)
Environment: high resolution, tt
Posting-number: Volume 19, Issue 80
Archive-name: rsn
Supersedes: atw: Volume 10, Issue 10-15
```

"Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site. This will usually be the same as the "From:" line in the article's main header.

Certain information about the system configuration required to use the program is given on the Environment: line.

```
Environment: 1meg, medium res, high res
```

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory. Examples:

```
high - runs in high resolution (monochrome)
medium - runs in medium resolution
low - runs in low resolution
1meg - needs 1 meg of RAM
ste - requires an STe
tt - requires a TT
```

The "Posting-number:" line repeats the volume/issue information for the aid of notes sites and automatic archiving programs.

The "Archive-name:" is the "official" name of this program in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

The "Supersedes:" header line, if present, indicates that the program replaces an earlier version.

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-by header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

HOW TO OBTAIN OLD ISSUES

There is currently no officially documented archive for this group.

Yes, it is to be an 040/33mhz card.
No. Suppose to be under 1000.00 U.S. for entry model.
Has been placed on "Back Burner" by Wizztronics.
Suppose to be an 030/48mhz "Hawk" available soon for 750.00

>Does it dramatically improve Falcon performance?

Probably like setting a GM671 Blower on an LS7 at 20% overdrive. :)

I agree 1000 percent! If it's anything like MagicC on the Mac
or the ST I'll be forever happy:) (Still will be looking for
on 040 card though.) That makes me think. If NVDI is optimized
for the 040, and surely MagicC Mac is or could be, that will be
a milestone upgrade for the Falcon. Come on GE-Soft and Wizztronics,
wheres the 040 cards? :)

: (RJ-45). Is there anything available, or is it time to get out the
: assembler? <g>

The TUW TCP package and MintNet have documentation and drivers for D-Link PC parallel port ethernet adapters connected to the cartridge port. You will need to make an interface circuit for this. There are also SCSI ethernet adapters around, which will give you better throughput, but I don't believe any drivers ahve been written.

D-Link make a 10baseT adapter but I don't know if any SCSI-ethernet supports it directly. You would need to use an external transceiver on the AUI port in that case.

As a rough price guide, new D-Link adapters cost less than #100, transceivers about #20 to #40. I don't know if anyone still makes SCSI-ethernet adapters (at one point they were popular with Apple Mac's), so you would need to search for a 2nd hand one.

> I've tried is on a 1meg 1040st with TOS 1.4 (1.04), and a 4meg 1040ste
> with TOS 2.06. In both cases there wre no acc or autoprograms in memory,
> just grandad. Has anyone out there got it to run?

I've managed to get it to run OK on both an STFM and STE. I downloaded it from src.ic.ac.uk/packages/atari/umich/Games/Adventure/ and unzipped it using DCXTRACT PLUS. In the process I noticed that the archive contains 2 AUTO folders, one with Grandad2.prg and the other with nothing. I obviously decoded the Auto folder with the prg and ignored the other.

Drop me a note if you can't get it going and I'll zip up my working version for you.

Regards,
Pete

SB> Olaf Guethe. If you manage to get Civilian up and running
SB> thanks to CivilFix, send Olaf an email - I know he'd
SB> appreciate that. He's on "olaf_guethe@hb2.maus.de".

I have run Civilization on my Falcon without any fix - just do not use the Install.PRG to put it on to HD. With NVDI v 3.2 the screen colours are correct! Also, make sure Microprose supplies you with the Jul 14/94 disks.

Send E-mail to s.lyster@genie.geis.com or look to the Civilization TOPIC on GEnie to see the full discussion of how to run Civ on a Falcon.

That is what i have against it. First of all, they supported the old machines
rather than to support new ones, (i could have lived with support for both
old and new machines). Second, they have kept us fooled for so long now,
that it might as well had been an Atari Co. product rather than 2B,
Heidleberg or whoever they are.

I guess too many not kept promisses has taken my pleassure away.

>so inefficient compared to MagiC. If problems have been found, I would much
>rather wait for a product than pay 100 pounds (or whatever) for a buggy one
>and then moan about how long it takes for bug fixes to be released!
>

Almost a year ago we was told a Magic for the falcon would show up soon.
In the mean time we have seen version 1, 2 and now 3 coming up for the
ST/TT, but still nothing around the Falcon version. I didn't buy my Falcon
2 years ago, just to discover developers rather would support the old
machines. Even though it means more money for the developers of such
products, it's a thing like this which will drive people away from the
market. And what good would that bring them then ?
If noone is going to support newer models, there is no chance such market
will last. Thats a fact, specially in the computer business!

Since SoundPool in Germany manufactures the FDI's (even the ones that Steinberg sell under their own name) you should try to get hold of a retailer who sell their products - they definitely haven't stopped making them! Where do you live? In the UK, I think System Solutions sell them.

Best regards,

Claes

Source record: 158973

Hello android Simon G.K. Williams! The 09.09.95 you talked about "MagiC 3 and Calamus SL",and my reply is:

> What's the problem with Calamus? MagiC 3 hasn't been released in UK yet,
> but magic 2 works fine with the lastest version of calamus. In earlier
> version a fix exists for the text problems and windows. Note though that
> even the latest version seems to have probs with the text editor locking
> up unless you run Calamus in single mode.
>

The problems is with the Windows, overlaying one another.
It doesnt update the screen.. And the fixes i have tested doesnt work.
:-/

It was none other than kim@dksoft.ping.dk who did write on 15 Sep 95 that
... >> There is a Driver available for the DLINK DE600 Ethernet adaptor
>> (For MiNTNET). The adaptor plugs into the Parallel Port and has a
>> standard BNC thin ethernet connector on the other end.
>> I have had mine for ages but I have never got round to using it but
>> am told it does woek.
k> What are the speed then ? If it's slower than i Midinet, i doubt
k> anyone is really interested 8-)

on an ST it is ~90Kb/s .. on the Falcon then probably 150Kb/s would be about
a reasonable expectation ?? I haven't got round to using it in anger mostly
becuse I do not have a second adaptor to network it too :-(
So significantly faster than midinet <G>.. but these Adaptors are not cheap
at 100 quid each .. I acquired mine during a network upgrade I was working on
and someone emailed me a driver after I mentioned it in a MiNT newsgroup on
NeST :-)

Nice set-up. Could you please explain to a U.S. user what a
ROMPORT buffer is? Did you mod the internal SCSI connector or
is there a nice "kit" available? I have seen an article on the
NOVA graphic card in a Mag. Is there a current UK distrubtor?
Does the card have a PD pass through? (If that is how it connects).
Cost?

thanks,
Mike

STIRRE31@MAINE.MAINE.EDU wrote:
: From what I have heard, ST Guide will play MPEG files. I hope this
: helps. The only other viewers I know of are for the Falcon030.

This can't be right, the current English version of ST-Guide displays text or its compressed text, image hypertext format - it doesnt play MPEGs, display GIF's, play AIFF files etc.......

I think you must be talking about 1st Guide, which supports a number of formats - no idea if it supports MPEG though.

Cheers,

Richard

4026. PROGRAM ANNOUNCEMENT

Newsgroup: comp.sys.atari.st
Date: 1995-09-16 00:00:00 UTC
From: mud08@cc.keele.ac.uk
Message-ID: <43fgde$dgc@gabriel.keele.ac.uk>
Source record: 158978

```
****************************** ANNOUNCEMENT ******************************

Coming soon:

**************************************************************************
** SampleC - MIDI sample dump, sample conversion and librarian program **
** for the Atari ST, TT, Falcon series of computers. **
**************************************************************************

List of features:

1) Supported formats:

AVR signed and unsigned, AIFF including Cubase Audio, AIFF-C
(uncompressed), WAVE (.WAV), CDP soundfiles. Stereo and mono, 8-16
bit.

2) Can receive and transmit 9-16 bit samples via the MIDI sample dump
protocol.

3) Supports Atari CDP soundfile system (Soundstreamer etc.).

4) Converts between all supported formats - stereo to mono, bit conversion.

5) Non-modal interface, optimised for MagiC operating system.

6) VA_START and FREEDOM support for multiple file loading. Recursive file
selector allowing every available sample to be loaded in one operation.

7) Intuitive interface - drag and drop samples, enhanced GEM facilities,
'iconification' on all TOS systems.

8) ST-GUIDE on-line manual, KOBOLD support.

9) Active registered user support.

SampleC should be available within the next month, and will probably cost 12
UK pounds for registration within the UK - overseas costs TBA. An
unregistered version, which is fully functional but places an 80K limit on
all sample sizes and does not include the ST-GUIDE manual, will be available.
If you would like to receive the unregistered version, please send me a DSDD
disc with a stamped, self addressed envelope - I cannot return discs with no
postage paid.

Send to: SampleC demonstration,
Richard Evans,
3, Gervis Crescent,
Parkstone,
Poole,

>
>--
>- Thomas Hansen - E-mail: thomah@ifi.uio.no
>- Oslo, Norway - WWW: http://www.ifi.uio.no/~thomah

I have tried Lattice C 5.60 and Devpac 3 on an ST under MagX!
and all seems to work well except some of the menu functions.
This is true for all HiSoft products. True Image and True Paint
included. This also occurs under Magic C Mac.
I have just found a patch written by Uwe Semmit (excuse the spelling)
that is suppose to mend this problem for versions 2.0x of MagX!.
I have yet to try it.

Anyone else?

Mike

4028. Re: 1.44MB floppy replacement?

GO>> O.K. And what about those day when you recognize that you've written
GO>>the one and only version of your 300K sourcecode to a 1,44 meg disc
GO>>formatted with your WD 1772-02-02 and now (because the WD was out of
GO>>order) you can't get your sourcecode back?

GO> I will agree that pushing an 8 Mhz chip up to 16 Mhz is going to make
GO>it fail before it's time, but it still might give years of service.
GO> How about arranging the circuit so that it drives the WD 1772-02-02
GO>at 16 Mhz ONLY when there is a HD disk in the drive & the MOTOR ON
GO>line is active.

That is how most of the HD-kits work.

GO> If this works (and I only thought about it as I read this post),the
GO>WD 1772-02-02 would only get switched to 16 Mhz when it needs to
GO>read/write a 1.44 Meg floppy. As it would spend most of it's time @ 8
GO>Mhz, it should have a long life.

Imagine what happens when you format a 1.44meg disk? About two minutes of spending in 16Mhz mode. But I believe it is a question whether you want security for your data or not. The one person wants to save money by not buying an AJAX, the other has its data for the rest of the life.

Primal Rage was done by the other ATARI not Atari computers.
If you did't know there is one company called Atari they make arcade
games and is owned mainly by time warner.
and then there is the other company called Atari computers owned
mainly by the Tramiels.

Sadly Time warner has decided now to drop the name atari and call it
time warner interactive (TWI)

so Primal Rage and T-mek are the last arcade games to bear the name of
Atari.

but atari computer do have the rights to primal rage and a version
will be coming out for the jag.

Simon.

>THANK YOU FOR YOUR SUPPORT, ATARI!
I don't know if you have already recognized it BUT Atari Games and Atari
Computer
are two totally different entities and nowhere related not even by name
anymore.
And Primal Rage is coming to the Jaguar real soon - just check the talk
in rec.games.atari . Primal Rage is coming to nearly every home-computer
and
console system except for handhelds and dead - or so considered by the
general _game-making_ _industry_ - system like the ST/TT/Falcon
Primal Rage for the Jaguar is cool. I played it on a jaguar-CD and liked
it.

Got it; well: it seems that 1040ST doesn't have enough resources to do the browsing at decent speed; What about an additional hardware? Wouldn't it be nice to make the Atari a "Net Engine"?, I know our machines have plenty of power to handle graphics (remember Metzer's Sketch) with the audio chip handling *.wav, etc; I see that most of the functions made by Net-scape... ok; we DO have all of them in many pieces of software; integration is the main thing our programmers are learning to do.

We have created a Synthetic Reality in order to satisfy the One, we believe, is Alive, inside our minds, our personalities, "don't let the flamme die out".
To all of you guys, have a good day today.

I have an Atari 520ST (upgraded to 1 Meg RAM) a SF314 external floppy drive and a SC1224 color monitor collecting dust. I also have 2 WICO bat handle joysticks and a WICO trackball. I don't know what this stuff is worth but I'm willing to listen to any offers.

Please email me at: barnesm@mail.oit.osshe.edu if interested.

> But I have fried my cart port... so I cannot try it!

Its not impossable, its just a bit-flipping nightmare. I belive its possable to

network two ST's together via parallel with MiNTnet, but a MiNTnet setup is
overkill for most people. How bad do you want it?

Are you trying to run it from Hard Drive?
This sounds the same as what I was getting when I tried.
Placing it on two floppies and it worked fine.

On a sligtly related line, I asked a week or so a go if Mr Scott was still
doing regerstrations, the answer is a definite yes!
I got my key code and matrix with in a week, so prompt service as well :}

No. I remember that you can read ST disks by screwing around with the geomtry settings of a PC file handler. I forgot the name of the program that I used (this was around 1989, 1.3 days, pre Cross DOS) MessyDOS was it? I got a ST disk to read via my A2000's internal drive.

I also got an (get this!) MSX comptaible Yamaha CX5M music computer with a FD03 disk drive disk to read in my A2000 as well...

Try messyDOS.

>I was wondering if MiNT is a re-write of TOS to make it multitasking or
>whether MiNT sits on top of TOS? Thanks in advance.

MiNT is just replacing the GEMDOS of an existing TOS and allows you to
run several GEMDOS-processes parallel. AES and VDI will not be changed,
so you can only run TOS/TTPs parallel in windows using the TOSWIN-accessory
of MiNT. Or a single program can create threads running in background
parallel to the current program.

To run GEM-applications parallel you have to use MultiTOS - this replaces
the AES or MagiC - this is a *total* replacement of the whole TOS(!).

Yeah, I agree. The Geneva upgrade has a lot of work in it. I did not mind paying a few dollars to get it. They're really not asking for much.

Plus, it'll be nice to have a supported AES replacement that works with MiNT.

Hi my name is Raymond Lohengrin, Yes, it is possible to adapt a VGA monitor to be used with the ST etc. I talked to a technician in town and he told me that the conversion is very simple. basically all you need to do is to isolate the cables that send the B&W signals so that only these signals go to the monitor. The other signals for color are grounded. He uses SW to select the connection to VGA and bachk to regular ST monitor mode. He told me that I needed to make sure my monitor could handle the ST
monitor frequency. I am trying to get more deatils on this. at the present I have no real need for this because I use my Falcon with the SVGA monitor.

No, only Netscape, because it defaults to .au files, and afaik the others
dont do this unless you have external client software. Lynx does not
have any facility such as this.

I've written Dan and heard that these files would NOT be available electronically, and I can't fault Gribnif for wanting to make some money on the upgrades, although I can't see the logic of preparing and mailing three disks for the same. Good way to make sure you get paid, though.

Perhaps they ought to make them "guiltware," with a say, $3.5o charge per upgrade if you got the files electronically. Another option would be a world wide web page where you could enter your name address, and billing authorization before they zapped it to you or let you zap it from them.

Heckuva a good company, Gribnif--I want to see them do well.

>How much does Octopus cost to register Paul?

Hi Karl. Sorry to butt in.
Speaking about Octopus, the "only" much you get is the program. Koos is only asking 125 DHL, (That should be Dutch Guilders), or DM115,- or 90$,- In my opinion he could ask at least twice as much for his program, (and it would still sell). That is compared to many others sharewar/commercial BBS systems i have tried ofcouse. Octopus is a damn fine program, and Koos is working very hard, (sometimes i think we push him to much 8-)), making sure we're all pleased with his stuff.

I think Kevin Osborne runs the support for Octopus in the Uk, you may try ask him, if he's taking registration as well. If he doesn't, Koos is ofcouse available at NeST, like the rest of us. Try read the Octopus support area in NeST. There you will also get alot of ideas how it's like to feel Octopus for real. If you ask Koos, i'm sure he will provide you with a test key for a coupple of months, for free.
Koos is also avavilable in here, but unless he got the time off from coding you may have to write him email. Ofcouse i can't remember his email adress when i have to 8-/

When did this start to happen. It sounds like _the_ DMA problem many
STE's suffers from. Only fix is to get the DMA chip changed. Sorry mate.

There is a small .CPX which should be able to tell you more exactly what
the error codes means. Don't know if this .CPX is available to the publich
though, or if you have to get the PRO version.

It can be done allright, (have one running right here now). But you'll
probably only get ST-high res. as only very few monitores supports the
low frequences the Atari/Amiga uses. St-high will work fine though with
any VGA monitor.

I bought a HD kit from Hard&soft myself. My STE had the WD1772-02-02 chip, and
i had the very same problems Steve, (or was it Rod. I lost the original
message) mentioned. I changed the WD1772-02-02 to an Ajax chip, and now
my floppy works in 9 out of 10 floppies. Before i could hardly format
a single floppy.
I have been told it has to do with the WD1772-02-02 getting too hot. And
the Ajax is build for this purpose.

>

You sure can, and it should work right after, (have done it myself). The
only problem is, that the SF354 is a doubble height, so it will not fit
correctly in the case. But you can probably figure something out. I left
the top open in my floppy, when i used that one. Today it's no longer in
use.

I think bending up a pin should not cause any cracking. The pressure used to
push the IC into a socket is far greater than that of bending the leg. I think
those failure you mentioned about comtamination getting to the chip is more
likely due to delamination between the mold compound and the leadframe.

From: rcollins@magnus.acs.ohio-state.edu
Message-ID: <43irdb$ihm@charm.magnus.acs.ohio-state.edu>
Source record: 158915

I am configuring a Falcon, TOS 4.04, for a friend who has
NVDI version 3.01.

I am having configation problems with NVDI, SpeedoGDOS v. 5.0c and
AtariWorks v.1.2. I have talked to Compo about SpeedoGDOS and
have followed there suggestions without a satifactory solution. Compo
suggested I get in contact the makers of NVDI.

Also, I would like to find out if there is a USA source for
acquiring upgrades for NVDI.

In addition, I own an Atari TT030 with a Cyrel, Sunrise graphics card
from Cybercube Research. Is there a version of NVDI that works with
this card? Ralf Doewich, has expressed, (to me in phone
conversations) his willingness to work with the NVDI to develope this.

I am looking for an Email address here. If unable to obtain one I
will have to restore to the Snail Mail.

Raymond Collins	Atari TT030 4/4MB ST/TT RAM 245 HD

4077. Graphing Program for the ST/Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-09-18 00:00:00 UTC
From: plouie@isc.sjsu.edu
Message-ID: <43j0eu$sa8@nic-nac.CSU.net>
Source record: 158917

I was wondering what good English graphing programs are out for the ST/Falcon. I've heard of First Graph, but it's a bit old I think so I'm afraid it won't be Falcon compatible. (Correct me if I'm wrong.) Are there any other English graphing programs? PD/Shareware/Commercial is fine.

One feature that I need is the ability to highlight one point on a graph to distinguish it from the other points. Proper spacing on the axes would be nice. (ie on the axis is 100, 150, 200, etc., but a point is at 175 so the point should be placed between 150 and 200. MS Excel can't do that unless XY Scatter is used.)

Any help is appreciated.

Thanks, Phil

>> cheers
>>
>> arch.
>
>Doesn't the manual say not to use over system 6.0.5???

Er, dunno about the manual (lost that ages ago!) but I used system 6.0.7
with no problems and was even able to print to my Canon BJ10ex directly
from the ST printer port in Mac mode!

6.0.8 is a special release for machines like the Mac Classic which has
256k roms and I think, Color QuickDraw. It also facilitates printing to
the Apple LaserWriter.

Run system 6.0.7 and Spectre will do what it's supposed to do; emulate a
Mac Plus only faster and with a much larger screen area.

cheers.

arch.

: >whether MiNT sits on top of TOS? Thanks in advance.
:
: MiNT is just replacing the GEMDOS of an existing TOS and allows you to
: run several GEMDOS-processes parallel. AES and VDI will not be changed,
: so you can only run TOS/TTPs parallel in windows using the TOSWIN-accessory
: of MiNT. Or a single program can create threads running in background
: parallel to the current program.

Apart from MultiTasking, MiNT also adds a number of functions to GEMDOS,
and allows loading of external device drivers and filesystems. This is
how the dynamically resiable ramdisc, MinixFS and MiNTNet work. It can
also support many unix-ilke features of the filesystem, such as unix like
permissions, ownership etc. Of course if you run X Windows for example,
you can still multitask GUI based programmes, but not GEM ones.

With AES 4.0+ you can run multiple GEM applications. AES 4.0 is
part of the MultiTOS package. And there is MiNA apparently being
developed, though I haven't heard much about it recently. AFAIK, MiNA is
a PD Multitasking AES, similar to AES 4.x, but wih all WinX features and
more.

You *really* want vi??? :-) You don't mention what C compiler you have. You might be able to get away with using whatever libs come with it, or you could also install the Mint libs, which provide many UNIX functions, are free, and work with GCC, Lattice C, Pure C, and Sozobon/Heat & Serve C.

The mintlib sources and binaries are available via ftp from the usual places: atari.archive.umich.edu (or mirrors) and micros.hensa.ac.uk.

Cubase only runs in Hi-res mode. You could try getting a Hires emulator (Sebra is quite good) off the umich site or local mirrors, and try with that. You may find some of the text inside the buttons a little hard to read without the definition of a hi-res monitor but try it and see !

I alwayse have >to physically shut the system down to reboot. That is a pain.
I cruised the web looking for info on these drives, and discovered they were differential SCSi drives. Apparently this means they 'echo' the signal. the signal goes out and comes back on two different cables, which *I think* makes them no good for a falcon, or any ST.
Can anyone tell me any differently?

Try typing something like 'we are on a mission from god' (I don't
remember it exactly :-().

STarglider II was a kewl game as the same (dual-format) floppy worked
both on Amiga and Atari. It's also one of the few action games that
work both on ST color and monchrome resolutions (for mono I prefer
STarglider I as filled polygons don't look as good on mono).

Gard Eggesboe Abrahamsen (ga@www.hials.no) wrote:
: Recalling that I have seen subject titles concerning ZIP-drives on csas, I
: looked back and found a lot of discussion about SCSI-based ZIP-drives. I
access
: a ZIP-drive which connects to the _serial port_ (very nice for cross-platform
: transportation of loads of data) of any computer which has a serial port
(which
: is most computers these days). Does anyone know of any drivers/utilities for
: making use of this kind of ZIP-drive for harddisk backup on an Atari MSTe?

I find this very hard to belive. First, looking at any of the decent catalogues, like Misco or the like, they only list a SCSI and a parallel connection for the ZIP drives. There is no mention of a serial interface. Second, a serial connection would be horribly slow, even running at a high baud rate of 56k or above.

Serial and parallel ports look alike, execpt for gender. A serial connector is a 25-pin male (on the computer), where a parallel connector is a 25-pin female (on the computer). There are real-life stories of people pluuging printers into modem ports, and vice-versa. Check your connectors, chances are it's a parallel connector.

ObHistory: years ago, in the early 80s, there were a mixture of connector types. Some vendors would use male connectors for serial ports, and some would use female connectors. The confusion still exists, but with less likelyhood, given the 9-pin serial connector.

There should be a program called UNDELETE.TPP that should work. You
just type in the name of a file that's been deleted(but still on the
FAT table). I'm sure wildcards can work, but make sure that you have
not added or change any files which overwrites the deleted file.

I got this with Knife ST from ST Format coverdisk, but I think I seen
it on PD. Hope this helps.

4108. Re: Questions--1040STFM

Newsgroup: comp.sys.atari.st
Date: 1995-09-18 00:00:00 UTC
From: tom.thomason@fpc.ct.se
Message-ID: <ftn_2.203.203.15$fidonet.org_305d7006_Tom.Thomason@fpc.ct.se>
Source record: 158948

On 15 Sep 95, Gaven Miller shot this through the ether to All ...

GM> Of all ST models, the letters following "ST" tells whether you have an
GM> RF modulator (to use a household TV) and/or a built in Floppy drive.
GM>
GM> M = Modulator
GM> F = Floppy drive
GM>
GM> The STE model is essentially a STFME, with the 'E' meaning Enhanced.
GM>
GM> So, a 1040STF has a built-in Floppy, whilst a 1040STFM has both floppy
GM> and modulator built in.

Almost full points. The original ST (no additional letters) had an external single sided drive. The STf model also sported a single sided, though internal, floppy drive which was later exchanged for a double sided drive. The STfm, as you've pointed out added the modulator for using a TV set as a monitor.

GM> An STM model (modulator Included) only ever came in the 520ST "body".
GM>
GM> The Mega ST was a STF in content, but was in a "Pizza box with keyboard
GM> attached" body. The Mega STE was a STFE in content and was marketed as a
GM> "cheaper alternative to the TT" in an ST-coloured TT case.

The Mega ST was somewhat more than a standard STf as it added the internal bus
to the basic machine. The MSTe was a 16MHz variant of the STe in the same case as was used for the TT (although a different color).

GM> The memory controller in the computer can cope with one or two banks of
GM> chips, being either 512k or 2Megs. Therefore, permissible values are 512k,
GM> 1 Meg (512k + 512k), 2 Megs, 2.5 Megs (2M + 512k) and 4Megs.

The 2.5 Mb configuration needs a software fix in order to work. The only exception I know of is the Marpet Xtra-RAM board which allows the machine to be upgraded directly to 2.5Mb. They also make a board which makes it possible to expand ST's to up to 12Mb (4+8) using the original card plus SIMMs. (I wrote this before reading your next paragraph.)

GM> If you opt for a third-party expansion option, you may be able to use
GM> SIMMs, but these vary in design, so I can not go into detail with any
GM> certainty.
GM>
GM> Only the STE models used SIMMs as "native" memory, as opposed to RAM
GM> chips on the motherboard for earlier ST models. (although I do recall that
GM> they might have been able to use SIPPs)

All ST's can be adapted to use SIMM's. The most common cards are those from Marpet. These use standard 30 pin SIMM's. The minimum speed for these to work correctly is 150 ns, but you can't find SIMM's this slow on the market today. The standard SIMM speed today is 70 ns, although some supplies of 90 ns SIMMs may still exist. There's no price difference between the two.

ATB,
Tom

The worst were the 'CERDIP' packages. Worst yet was when
production persons were doing them in large numbers. They got carried away
and became sloppy, putting more stress on the chips. BTW, the 1772 in my
STe was a CERDIP package. I took care pulling the pin out of the via and
up

s> leave my write verify on because without it partitions get trashed
s> randomly.
s> I would appreciate diagnostic advice, posted either to this
s> newsgroup or to my email address as below.

I can't swear that this diagnosis is right but I have had the same thing happen to me. I reckon that the formatted tracks on a HD are subject to wear and fade as time goes by. Temperature can slightly alter the geometry of the HD and make this problem worse. From what you report the errors are occuring at the outer edge of the disc in the partition info. and FATs of the first partition. This is always the one which gets the most use.

So.. what's to be done? My problems went away when I allowed the disc to warm up to operating temperature and then reformatted and repartitioned it. I suppose the attractiveness of this depends on whether you can back up the data easily.

Alternatively you could try running the ICD Clean Up prog. which will mark dodgy sectors as bad so they don't get used. OR the ICD HDUTILS prog. has a facility for scanning the disc and mapping out bad sectors. My only concern about this is that these progs. may well refuse to map out strategic stuff like boot sector info. and FATs. Worth a try, though, before you dive into the long-winded fix.

Message-ID: <ftn_2.203.203.15$fidonet.org_305d6f00_Tom.Thomason@fpc.ct.se>
Source record: 158951

On 16 Sep 95, Michael Grove shot this through the ether to All ...

>> I've noticed a few mentions of the Baracuda-040, though nothing that has
>> given me any real information. I believe it to be an 040 accelerator for
>> the Falcon. So my questions are:
>> Is this available, and if so at what price?
MG>
MG> Yes, it is to be an 040/33mhz card.

Barracuda is a 68040LC card with a CPU speed of 66MHz.

MG> No. Suppose to be under 1000.00 U.S. for entry model.
MG> Has been placed on "Back Burner" by Wizztronics.

Steve Cohen informs me that the Barracuda will be released in the first
quarter of 1996.

MG> Suppose to be an 030/48mhz "Hawk" available soon for 750.00

The basic version is 33MHz. The 48MHz version pumps the 3-4 MIPS of the
standard Falcon up to 16 MIPS. The speed increase is currently rated at between
400 and 500%.

MG> Steve Cohen has stated that is their main goal with the "Cudda".

The Hawk documentation states "100% compatibility".

The above information comes from _direct_ contact with Steve and from the
material I received from Wizztronics today ((18 September).

ATB,
Tom

4113. B.Ware Software is Dead

Newsgroup: comp.sys.atari.st
Date: 1995-09-19 00:00:00 UTC
From: Mark Butler <Mark@dwell.demon.co.uk>
Message-ID: <258954299wnr@dwell.demon.co.uk>
Source record: 158803

B.Ware Software is Dead.

B.Bytes Computer Systems and B.Ware Software of 19 Southfield Road, Hinckley, Leicestershire, LE10 1UA, UK. has officially closed.

Unfortunately the little income from Shareware Registrations was insufficient to cover the bank charges and persistent overdraft.

New Arrangements for Registration and Support of Super Card 3 will be announced shortly. Please don't try to register via B.Ware for the time being as the bank account is closed.

A new version of Super Card and a lower Registration fee are promised.

It is likely that users who Registered over 12 months ago will be given the option to re-register for a small fee - Possible Five Pounds, should they want any further assistance or later versions of the program.

We hope that you consider this to be fair.

Any moneys received will be used to help pay off our creditors.

Ownership of all other B.Ware software titles will revert back to their original authors to do with what they want.

Some B.Ware titles will be released as Public Domain that were formally Shareware.

This in no way effects Lottery Companion 2 by Mark Butler.

Thank you for your interest.

Mark Butler and Chris Beale.

4115. STOS Falcon Extension v1.1a

Newsgroup: comp.sys.atari.st
Date: 1995-09-19 00:00:00 UTC
From: jacquesa@cs.man.ac.uk
Message-ID: <43mhb4$3jm@m1.cs.man.ac.uk>
Source record: 158805
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech,comp.sys.atari.st

```
**************************************************************************
Announcing the release of the STOS Falcon Extnesion (v1.1a)
**************************************************************************

You want to program your Falcon, yet you dont feel like taking on C or
assembler? Well, you want the STOS Falcon Extension. This extension to
the STOS programming language allows you to easily create Falcon only
games / programs.

Commands include DSP replay of 4 track .MOD files, up to 32 track .DTM
modules, Access to the Falcons sampling hardware, true colour sprites
(with pixel perfect collision detection) hardware scrolling support and
much more.

The extension is shareware, with a registration of 5 uk pounds. An
un-registered version can be downloaded from various ftp sites (uploaded
to incoming directories on 19/9/95) listed below:

micros.hensa.ac.uk
ftp.cnam.fr
ftp.un-kl.de
ftp.tu-berlin.de
ftp.cs.tu-berlin.de
ftp.stuttgart.de

A version can be downloaded via the WWW at the address given below.
For more information email me (Anthony Jacques) at:

jacquesa@cs.man.ac.uk

http://www.cs.man.ac.uk/~jacquesa/falcextn.html

Source record: 158806

On 17 Sep 95, afn14016 shot this through the ether to All ...

a> mode. He told me that I needed to make sure my monitor could handle the
a> ST monitor frequency. I am trying to get more deatils on this. at the
a> present I have no real need for this because I use my Falcon with the SVGA
a> monitor.

What he means is that if you want to be able to run ST Low on an SVGA monitor it has to be able to get down to 15kHz. In actual fact, we've discovered that 20kHz will do. Unfortunately, there aren't many VGA/SVGA monitors that do this. You might look around for a NEC 3D.

Regards,
Tom

> thanks.merci

I'm no expert on SCSI - but I know what you are talking about.

AFAICS it might well work. Effectively a non differential SCSI bus has all
the 'return' lines grounded. However the differential device is not to know
that - and still should just measure the difference between the sets of
pins.

I can't see it hurting to try. YMMV though.

All AFAIK and IMHO.

:-)

Roland.

Why do you use both NVDI3 AND SpeedoGDOS?
You don't need GDOS anymore, because it's functions are built into NVDI3, so I'd suggest you to remove GDOS. How to install Speedofonts and Truetype fonts, as well as printerdrivers is described in the users manual, so take a look in it.

PN> Any help is appreciated.
PN>
PN> Thanks, Phil
PN> :w

I, too, am looking for one or more graphing programs. I have looked
at First Graph. The demo _will_ run on my TT (in ST resolutions,
because gdos 1.1 will not run in TT rez's), so it might very well
run on the Falcon. I do not know whether it will highlight a point
or not. I will wring out the demo some more after I get a good gdos
(Speedo or NVDI). It is still available from ABC Solutions via Toad.
Atari Works' spreadsheet module includes a graphing program. LDW
Power will graph things also. I tried running Grapher 2.43, but
didn't enjoy it much. KSpread 4 (not Lite) included a graphing
prg., but I have not seen it for sale recently, although Lite is
sold by Toad.
I would have to check with Toad if I were you.

I am not the author, Mark Matts, who has reportedly gone some sort
of awol, but TeddyTerm2.14 is super. I am using STalker, and love
it, but I recommend Teddy to my friends who are just getting
started. It was shareware, but with Mark Matts out of Atari and
offline, I don't know what its status is now. It is well worth the
shareware fee, IMHO.

Well with one of the several ST disk formaters out there, you could just
use one to format the a disk into PC comapatible format. ST's can read PC
formatted disks. I'm not sure but I think a friend of mine who has an Amiga
used some special software to read and write to PC formated disks.

Later...

Hello,

I am writing the code for the dialer for the graphic NOS replacement
(ICE).

I have completed the basic Dialer routine, but at the moment it is Demon
specific. In order to make the dialer as flexible as possible I need to take a
look at as many different NOS dial scripts as possible.

To this end, I would be grateful if people who do bit access the 'net via
demon.co.uk could send me their DIAL.TXT file. Obviously you will want to keep
your password secret, but I need to see where it is entered, so please replace
your password with the releveant number of '*' characters, ie if you password
is rover replace it with *****.

Thank you in advance for youyr help.

4131. 2.5" IDE hard drives

Newsgroup: comp.sys.atari.st
Date: 1995-09-19 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <43nrcu$je5@gti.gti.net>
Source record: 158863
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The Falcon uses a 2.5" IDE hard drive, which is not exactly cheap when you want more disk space (a 540mb 2.5" is about $450! Compare that with a 3.5" of the same capacity for about $140!). So I know some people who run a used computer store, and in their stock room was a box of 2.5" hard drives. Some had labels like "grinds", or "loud", but most were unlabeled. I grabbed five of them, four unlabeled ones and one that says "loud".

So I yanked apart my Falcon, and plugged one of these in, on the off-chance that it might work. No such luck. All five have the same results: nothing! I put a diskette in with AHDI on it and ran that, but it didn't recognize any hard drives.

Since I got them for nothing, I said the hell with it, and opened up a couple of them to expose the mechanics. When I power on the Falcon, the disk platters don't spin or anything. So now I have three of these left (and the chance to grab many more!).

Since this is a used computer store, and they get this equipment in auction lots, theres a good chance that the drives may not work. But then again, there is just as good a chance that some may work. The owners bid on lots, and most of the lots are what companies deem "obsolete".

So now I am wondering if there is anything to be aware of when working with 2.5" drives. I know they are "normal", having a really small interface cable, and several more pins. The pin configuration matches the Connor drive that is in my Falcon: there 44 pins, an empty spot, and then four more pins. These last four pins don't connect to anything, so I assume it's either external power or HD ready light. I know power is normally supplied on the extra pins 41-44.

The drives themselves are called "PrairieTek", and the model is "Prairie 120", which I assume means 120mb (a far sight better than 85mb that I have now!)

There is no such tool and I doubt there will ever be one. In my opinion it
makes no sense to use a serial port if you can have SCSI. All serious
platforms allow SCSI devices today and this way cross-platform
transportation is no problem at all.

Message-ID: <811498894.6616@saffron.imc.exec.nhs.uk>
Source record: 158866

MagiC (2 or 3) is probably your best bet IMHO. You can blow it into EPROMs and replace your TOS chips if you want. MagiC is quicker than MTOS (although it doesn't do as much).

You may have problems with old software not expecting to be run in a mtasking environment - either upgrade them or find alternatives. I use MagiC 2 (when I don't use MTOS) and don't have any real problems, but then most of my software is:
a) recent
b) from Germany

It is possible, but only for getting a monochrome picture.
Low and Medium resolutions need a monitor that has a horizontal sweep frequency
of 15kHz and most SVGA and Multisync monitors can't handle anything below
30kHz.

Best regards,

Claes

: >> the Falcon. So my questions are:
: >> Is this available, and if so at what price?
: MG>
: MG> Yes, it is to be an 040/33mhz card.

: Barracuda is a 68040LC card with a CPU speed of 66MHz.

: MG> No. Suppose to be under 1000.00 U.S. for entry model.
: MG> Has been placed on "Back Burner" by Wizztronics.

: Steve Cohen informs me that the Barracuda will be released in the first
: quarter of 1996.

: MG> Suppose to be an 030/48mhz "Hawk" available soon for 750.00

: The basic version is 33MHz. The 48MHz version pumps the 3-4 MIPS of the
: standard Falcon up to 16 MIPS. The speed increase is currently rated at between
: 400 and 500%.

: MG> Steve Cohen has stated that is their main goal with the "Cudda".

: The Hawk documentation states "100% compatibility".

: The above information comes from _direct_ contact with Steve and from the
: material I received from Wizztronics today ((18 September).

: ATB,
: Tom

Hi Tom...
What leads you to believe that Wizztronics will get it together this time ?
The Barracuda was firstly announced for release around two years ago.
They've almost broken Atari Corp.'s world record in delayed releaseing ! :-)
Do you know what we don't ?

Hopeful but Pessimistic,
Martin

Well, if you have 4 MB installed in your STfm, you should go for MagiC 3.01.
It's the fastest multitasker OS avaiable for the Atari.

Keep Cool and Flying....

ChainXOR...

4142. FS: Atari 1040ST and color & mono monitors

Newsgroup: comp.sys.atari.st
Date: 1995-09-19 00:00:00 UTC
From: klassa@aur.alcatel.com
Message-ID: <43md58$50u@aurns1.aur.alcatel.com>
Source record: 158874
Cross-posted to: comp.sys.atari.st,triangle.forsale

Hi All-

I've got a 1040ST (1MB RAM, TOS 1.4, 720K floppy, mouse) for sale, along with a color monitor and a mono monitor. Everything is in good working order, but the mono monitor occasionally flips out and requires a tweak to one of the pots.

Take everything for $250 (OBRO), or take pieces as follows:

1. Atari 1040 $150 (OBRO)
2. Color Monitor $100 (OBRO)
3. Mono Monitor $50 (OBRO)

I'm willing to ship via UPS (COD, payable by money order or equivalent)... Buyer pays the shipping costs.

Thanks a bunch-
John

From: L.J.Sak@kub.nl
Message-ID: <L.J.Sak.4.305EA73B@kub.nl>
Source record: 158875

Well, I don't have that much, but I want to join too :)

it all started with a
-800 XL + tape + enhanced drive + plotter (toilet paper kinda' thing)
lots a flops and stuff (back in 1984 or 3 what was it)

then
-520 ST + external 3.5" and 5.25", SM124, RGB thingy, ATonce 286, 2.5Mb,
logitech Pilot (the first and award winning), own made HD drive $2 chip
enhancement. Quantum LP85s, advanced ICD+, NEC P2200 (when this was the
cheapest but still Costly)

and then finally till now:
-Falcon 030, 16 Mb (in the times where chipmem did cost plenty), FPU,
logitech mouse, 17" digistuff Vortec VGA display (cost as much as the
computer did *grin*), Quantum, Connor, Mishumi HD SCSI (some 500 Mb),
Epson Stylus 800, Star sj48 (blegh), Jagpad, simple handscanner, build
in bigtower (ownmade), external mega-st keyboard, DAT HP 16 Gb backup,
and of course a Screenblaster inside. Lots of soft too, but that's not
the contest..

Hmm, that's about it (roughly)

Hack, I saw bigger installations on this group, but I had something
to type :)

TTYL,

L.J.Sak@kub.nl

4147. Gnu C++ : Which files do I need ?

Newsgroup: comp.sys.atari.st
Date: 1995-09-19 00:00:00 UTC
From: charrier@int-evry.fr
Message-ID: <43mobh$ci1@news.cict.fr>
Source record: 158879

Hi everyone.

I recently tried to install the Gnu C++ Compiler on my Falcon, under Monotos.
I had already installed the Gnu C compiler and it worked quite well, but
for some reason the C++ won't work : when compiling the simple "Hello, world"
c++ source, the compiler finds a mistake in the include files (!).

So my question is : Could anybody give me a list of the files (possibly
with their respective versions) that I need to install both the GNU C
and C++ compilers under Monotos ? I know there is a GNU development kit by
Laurent Chemla at the CNAM site, but I do not want to use bash and/or emacs,
so I really need this list.

Thanks in advance,

Laurent.

4148. Screenshot program on Falcon?

It is a problem for an MSTe, whose internal interface supports only one SCSI device attached at a time. Of course, if any of you guys out there happens to know exactly how to alter the internal interface to handle >1 SCSI device, I'd be _very_ happy. (And it would also be included in my coming full Atari hardware and TOS/GEM documentation hypertext for ST Guide)

> them no good for a falcon, or any ST.
> Can anyone tell me any differently?
> thanls.merci
>
>
>
>
>>>>
No, they don't 'echo' the signal. Differential Interface is that each signal
has two wires and the Receiving end looks at the Voltage Difference between the
two wires without regard to GROUND. 4 volts is a HIGH and .1 to .4 would be a LOW.
I think a LOW is a 'ONE' or TRUE signal on the SCSI interface. The SCSI interface
used on ST, PC, MAC and AMIGA's are 'Single Ended'. Each signal line is referenced
to GROUND. FYI, converters if you can find them, cost from $100 and upward.
Hope this helps.

azog@gti.gti.net (azog) replied to a question by Gard Eggesboe Abrahamsen (ga@www.hials.no) regarding serial Zip drives. As far as I know, the Iomega Zip drives are available in only two forms: SCSI and parallel. Azog has partially missed the point:

Is there anybody considering or attempting to use the non-SCSI version (parallel) Zip drive with an Atari ST?

I currently own both an Atari 520ST without a hard drive (or SCSI adapter) and a 486 PC-compatible with a large hard drive but no suitable backup mechanism. I too would be interested in buying a Zip drive which could be connected to the parallel port of either computer as needed. At this point, I cannot justify spending much money on upgrading my ST when I already have a more capable PC around. However, a peripheral which would be an upgrade to both...

.....YES there is a system like PowerDos that is currently supported for the Atari TOS platform of computers. It is Universal NETwork that utilizes the LAN ports of the TT, Falcon, and MSTe computers, or the MIDI ports of the same when hooked to ST or STe computers. Fully transparent installation allows you to run through a network icon to build a path to any file on any computer attached to the network. It is a true Peer to Peer system. See our http://www.chatlink.com/~stinformer World Wide Web Page for pricing details.

.....Dear Michael, the parallel ports of the ST DO NOT have a control contact necessary for parallel communication. You would have to create a device that used the available Printer port pins, and then obtained a control contact from another source. This is usually done at the MIDI port when you need that extra control pin, but in your example, you would have to try for a control pin on the serial port or cartridge port and then build software to address it and use it. Seems the long way around for your purpose, but good luck to you. If you upgraded to MegaSTe machines you could obtain the use of the LANport on each machine and possible get it done using our Universal NETwork program. See our web page for pricing details.

4164. Free Agent news reader problems?

Newsgroup: comp.sys.atari.st
Date: 1995-09-19 00:00:00 UTC
From: followel@ix.netcom.com
Message-ID: <43mjs0$st7@ixnews4.ix.netcom.com>
Source record: 158896

I have been using the Forti's excellent Free Agent newsreader to follow this and the ST tech newsgroups. About a week ago Agent stopped responding to both groups. It picks up the new headers then starts to update the files. Then it proceeds to lock up and just sit there with that damned little hourglass on the screen. Has anyone else experienced this problem? Could someone have u/l some kind of strange character in their message that could be causing this. I've never experienced this kind of problem before and it only does it on the two Atari ST groups. Any help would be greatly appreciated. Thanks in advance.

Sincerely,
- Byron Followell

Hey everyone,

Well, I got a great number of responses back from interested parters on the Development tools. I have e-mailed the lucky ones who will be recieving stuff. Sorry I didn't have enough to go around for everyone who replied, but maybe some others here will follow my example and find some of their Atari stuff just collecting dust.... ;-)

Larry

Kim Andersen (kim@dksoft.ping.dk) wrote:

: You forgot to say Atari ST/TT platform, as there still isn't any Falcon
: version available.

Fair enough.

: Almost a year ago we was told a Magic for the falcon would show up soon.
: In the mean time we have seen version 1, 2 and now 3 coming up for the
: ST/TT, but still nothing around the Falcon version. I didn't buy my Falcon
: 2 years ago, just to discover developers rather would support the old
: machines. Even though it means more money for the developers of such
: products, it's a thing like this which will drive people away from the
: market. And what good would that bring them then ?
: If noone is going to support newer models, there is no chance such market
: will last. Thats a fact, specially in the computer business!

But they are trying to support the new machines! MagiC 3 was only ready for the ST/TT first because it was much easier to code! MagiC 3 for the Falcon is coming - you'll just have to wait. Put it another way - everyone has been waiting ages for Windows 95. It looks like MicroSoft eventually decided to rush out a nearly bug fixed version instead of waiting just that little bit longer (media pressure etc.) The result? Some people think its excellent, many people think that it would probably be excellent if it installed, didnt need 16 meg and a P90 to get any kind of speed, didnt produce GPF's every five minutes........

If you want to use MagiC on the Falcon, why not get the ST/TT MagiC and the Falcon patches available by ftp - you would at least have a decent and reliable multitasking OS for non-Falcon specific serious work, and could switch back to TOS for DSP, sound hardware, games etc. You could then upgrade to MagiC 3 when it is ready.

Cheers,

Richard.

-=-=-=

Tools: These are really few in number, and quite simple to come by. Mr. Lew suggested some non-TV type of tools, but I'm going to stick to my guns here, and insist that you use the right tools for the job! You'll need a Phillips screwdriver, preferably a #1 size. (If you don't know the difference between a Phillips, and a slotted-head screwdriver, let me stop you right here, and suggest that you return to your programming!) You'll also need two TV "tuning tools": a hex-tool, 3/32" ("across the flats", as they say) and a flat-bladed tool, 1/8" or so in blade width. Both of these tools should be made of non-conductive (plastic) material, and longer is better! A make-up mirror is also quite handy, particularly a free-standing one. I might also suggest a thick towel or other material to protect the face of your monitor and the top of your desk, during the time that you are moving it around. Finally, the toughest item of all...some CLEAR SPACE! You'll need to move the monitor around a little, and of course, it will need to be connected to your CPU (and I DON'T recommend trying to balance it in your lap!), so plan accordingly.

Next, let's try to orient ourselves, so that you aren't amputating the screen, while _I_ am talking about the power cord! The "front" of the monitor is the viewing screen, the "rear" is where the power cord, and CPU/Monitor connector cable exit the case. Since we're going to turn the entire thing around, so that the screen is facing AWAY from us, "right" will now be the side where the speaker is located, and "left" obviously (it IS, isn't it?) will be opposite that, where the control knobs are. "Top" will still be in its usual location, and if you haven't already figured out where the bottom is, it's time for another cup of coffee!!!

Ready? Here we go!

Boot your system, using either the desktop, with one or more windows opened, or call up a text file. The ideal situation is to have text reaching all four corners of the screen, so that you will be able to compare from one area to another.

Now, unplug the monitor's power cord from the socket in the cabinet, and turn the monitor around, so that the rear of the case is facing you. Place the towel or padding on the desktop in front of the monitor, and tip the entire unit up onto the glass face (carefully!). Now, using the Phillips screwdriver, remove the 5 screws holding the cabinet together. (Two on the bottom, one on each side, about 3/4s of the way up, and one just above the power cable socket.) Once these have been removed, put them somewhere safely out of the way, and don't worry about mixing them up, they're all the same size. Now, gently lift straight upwards on the rear sides of the case, and it should begin to lift away...CAREFUL! You have yet to disconnect the speaker wires, and there's not too much extra wire here. See it? Carefully reach down to the connector where it joins with the mother board, and pull it straight away from the board, disconnecting it. Don't be too concerned about the orientation of the plug, as it _will_ work in either direction. Once you've done this, continue

to lift the rear section of the cabinet away, feeding the CPU/Monitor cable through the opening as necessary.

Set the cabinet out of the way (And don't STEP ON IT!), and proceed with the REAL modifications! Tip the monitor back down to its bottom, and arrange the mirror so that you can see the screen while working at the rear of the unit. Re-connect the power cord, and turn on the monitor, being careful to NOT stick your fingers inside the wrong areas!

Grab your plastic flat-blade tool, and start looking along the right side of the mother board (remember now, we're looking from the rear of the set!). Near the front of the board, neatly tucked between the picture tube, or CRT, and a vertical metal heatsink/power board, is a row of 3 white adjustable controls, or potentiometers, about 1/2" in diameter, labelled "VLINE", "VSIZE", and "VHOLD". We're interested in "VSIZE", which is the middle control "pot". (NOW you know why I suggested a _long_ tuning tool!) Gently slip the tool into the slotted head of the pot, and while watching the screen in the mirror (you DID boot up the system, didn't you?), begin to turn the tool slightly (try not to apply much pressure to the pot, as that CAN effect the setting). The top and bottom of the screen will begin to move, together or apart! Expand the screen to within approximately 1/2" - 3/4" of the top and bottom of the "bezel", or plastic frame on the front of the monitor. (Too close to the bezel, and you'll find that you have to be EXACTLY in front of the screen, or miss some of the information!)

See? Feeling more confident already, aren't we?

Moving right along, we will now swap our tuning tools, opting for the hex-shaped one. Looking near the left rear corner of the mother board, close to the point where the power cord socket is located, you will find a plastic shaft with a slot in it, sticking straight up from the board, and just slightly ahead of that, a strange-looking device, composed of a small-diameter tube, with what appears to be a couple of "bobbins" of wire on it. Inside of that small tube, there is a small, somewhat fragile core of graphite, which WILL break, if mistreated, so act accordingly! Gently lower your hex-tool into this tube, and you will feel it slide home into the core. (Again, don't press down on the core.) By turning this core in a clockwise direction, and watching the mirror, you will see the screen shrink slightly first, and then grow WIDER!!! (Now we're really starting to cook!) Remember to leave about 1/2" - 3/4" border, to avoid having the edges hidden by the bezel.

What's that you say? Your picture got larger, but it looks off-center? Well, cheer up, bunkie, 'cause we're gonna fix THAT right now!

See that big chunk of glass up front? Well, it has a "neck" on it, and the back end is pointing directly at us, with some strange

looking electronic stuff along the way. At the very back of the tube are some electrical connections, but we're not worried about them...what we're after are the two magnets that look sorta like "Q"s around the neck, about 1-2 inches forward of the connections. See 'em? They're dark grey or black, probably, and have a little "ear" sticking up away from the tube, so that you can _gently_ push them around until you get the picture centered on the face of the CRT. Don't worry about touching THEM...just try to keep from resting your hands on any "hot" contacts! This may take a little time to screw up your courage, but once you get the hang of it, you'll find it quite easy! Once you've got the picture fairly well centered, you may need to go back and readjust the VSIZE or Horizontal size, as all of these things are interrelated.

Next, we're gonna make the picture sharp again, in case you're worried that you've just lost that beautiful screen that you love so much!

Remember the slotted plastic shaft at the left rear of the mother board? Well, THAT's the "FOCUS" control, and if you'll again resort to the flat-bladed tuning tool, you can use that control to find the best compromise for YOUR taste! Atari chose to go for a tack-sharp center screen, and let the corners be a little softer in focus. You can do the same, or go for sharp corners and let the center go a little soft, or shoot for some compromise. (Hey! Life's a compromise!) Once you've done this step, you can actually turn the set around, and admire your handiwork!

If you see some other minor fine-tuning that you want to go back and do, feel free. This is now a CUSTOM-TUNED monitor of the first rank, and you will have even more pride in your ST than before!

To reassemble the cabinet, turn off the power, slide the CPU/Monitor cable through the rear cabinet section, and with your third hand...yep, gotta remember to reconnect the speaker leads! There IS a sort of indicator as to which way the plug was originally connected...One side has two slots, and the other side has only one, but the speaker WILL work even if this connector is reversed. Incidentally, if you want to go one step further, Mr. Lew suggests the addition of an Audio-OUT connector from this lead. Your choice.

Finally, having reassembled the cabinet, re-connect the monitor to the CPU, boot the system up, and check out the BIG PICTURE!!! If you have any problems, check first, to see that power is reaching the set, and that the green LED indicator is on. If not, you may not have reconnected the power cord securely, or possibly a fuse has blown or been broken (fuses are located on the vertical power board at the side, near the VSIZE pot, and easily replaced from Radio Shack).

Enjoy your "new" monitor, and if you have any questions on this modification, you can reach me here, on CompuServe, at PPN 75046,476.

Seeya! [Jack]

:> MDG> TT/MagicMAC follows - it is fully VDI friendly and will work in
:> MDG> 2/4/16/256/16bit/24bit/32bit colourpacked pixels. It has been tested
:> MDG> under MagicMAC and a TT with NOVA/Matrix cards, unlike the DSP version
:> MDG> it supports all MPEG frame types(I/B/P).
:>
:>Wow. Special delivery! Thanks, but what about the DSP version? Why doesn't the
:>DSP version support I/B/P frames?

Adding P/B frame support to any MPEG decoder adds an order of complexity to the
program - my Falcon MPEG decoder was optimized for I frame(s), which at the
time seemed a good idea, but not such a great idea when you want to add P/B
frame support.... However I'll add Falcon True colour support and DSP acceleration
(IDCT/colourspace) to the next release of the above player. It still won't
be quite as fast as the I frame only version - but it will have the advantage
of still working on TTs and being VDI friendly.

::>And the billion dollar question. What happened to The Digital Sound Module for
:>the falcon? I want to KNOWWW!!!! :))

TDSM is still being worked on, however my University work has been more
important lately.

Yes it is possible to run a SLIP/TCP account using an ST, with a few provisos :)

The program you are looking for is AtariNOS which was based on the KA9Q software on the PC. It was developed for Demon Internet, one of the UK's service providers. It can however be configured to work with other providers (So I'm told, this is all IMHO). This provides a full "all you can eat" internet accoun with e-mail, newgroups, etc all except WWW access. This is available but beyond my scope to detail. For news and mail you can get NOS bundled with a graphical offline reader called Oasis.

A good place to start is demon.support.ip.atari as the "experts" in this field hang out.

Hope this helps.

Right know there is no PC Laptop version of Gemulator but I am sure Branch Always Software, the makers of Gemulator, will make one someday. The only Laptop I know of that can run Atari ST software is a Apple Powerbook. You can buy a European software program that lets Apple Powerbooks or any Mac run many Atari programs. I resell Mac's at my company GodFather Computer and you can buy the MagicMac program from many Atari dealers. I also sell the GEMulator 4 for the IBM/Clones so if you have a desktop computer, the $199.99 Gemulator 4 w/TOS 2.06 works real well.

I posted this last week and got a reply from someone in New Zealand saying there was a shop over there with a couple of combiners for sale. Somehow I managed to mess up trying to email whoever it was for details.

Could my New Zealand friend maybe send me the address or phone number of the shop please?

Sorry to bother everyone else.

These drives are SCSI, I hope (50-pin connector). If not you will have the
trouble of needing TWO adapters.

h> Of course... the big thing is COST!!!! As cheap as possible
h> please... I'll consider all kinds of odd kludges, if cheap enough, and

$35 if you are lucky, $70 otherwise! There ought to be some people who have
upgraded to Falcon and may have used the drive from their old ST set p -
but this will leave them with an unused host adapter.

>like to get on but he has no software.
>Any info you could provide me would be a real help.

If he has a dial-up connection, then any terminal program will do as long as it uses VT100 or ANSI. He can use ANSI, but for IRC it won't work right; it must be VT-100. There should be stuff on FTP, if you don't know any Atari sites then try ftp.toad.net/pub/umich. The two commerical programs that can be used are STalker 3 and Flash II.

If it's more like a direct connection, using SLIP for like a graphic browser, then that's more tricky. If he has the memory and a hard drive then the only thing I can think of is to use MiNT. If this is the case then please let me know.

What is this Auto-App called? (FPU autopatch).
While were on the subject of
MagicC Mac, Do you know of a fix for the HiSoft drop-down
menu problem while running under MagicC Mac? The menus drop
down, but you cannot select the "side" menus under True Paint,
True Image, DevPac3 or Lattice C5.60. I have tried the included
auto folder program included with MagicC Mac, but no change.
I also have this problem on my Mega ST running MagX! 2.0x.
I tried Ofir's patch, but that didn't help HiSoft's software.

With a Mac? I don't think anyone has written an AppleShare-compatable network
for Atari's yet. It would be very cool if someone did...

Yep, this "problem" was fixed in TOS 1.4 and up. I recommend Diamond Format for

formatting MS-DOS disks on pre-1.4 TOS versions. Works flawlessly for me. It
will even format HD disks for you people too lazy to upgrade your TOS when you
do a HD upgrade...

I used to use DLII before I got Diamond Edge. It allows you to browse through the disk and see all the files that have been deleted. Much more user friendly than a TTP. It should be on an FTP site somewhere. Diamond Edge works well for undelete, but its commercial.

Hello, yes it is possible to use more than one SCSI device with the internal ATARI hostadapter but you have to modify it quite a bit.
An alternative is to use a hostadapter from third party developers which allows to use up to 8 scsi devices.

It's not the s/w which interprets the BUSY signal. The modem does thiis and is supposed to send a BUSY esponse to the s/w. I, too, have a Zolt with the same problem - so far no one has been able to tell me how to make it detect BUSY. I used to think it was to do with the UK tones but obviously you have the same trouble in the USA.

It doesn't bother me too much as I have set S7 to 15 secs and I just get a No Carrier return after this time if the called number is busy.

I have heard that this was possible, but my previous inquiries on
how to do it brought no repsonses. Can someone say definitively whether
there really is a hardware hack that allows chaining a second SCSI device
from the Mega STe's built-in SCSI controller?

An early response would be appreciated since I can't sleep at
night wondering! :)

AFAIK there is only a driver for Calamus SL. I know someone who uses
this printer with Calamus. It might not be freeware by the way...
I don't know about that.
Pagestream might not be supported anymore.
If so new drivers will be very difficult to get.

Perhaps he requires Type 1 fonts? If that were the case, I'd actually recommend sticking with an older version of NVDI which didn't have a Speedo and TrueType engine, to save memory.

From: zap@eskimo.com
Message-ID: <DF70qp.8EK@eskimo.com>
Source record: 158827

I agree wholeheartedly! I can't get a decent endgame going. Whenever I get close I get 2 bombs. When I kill all other civilizations I get a scrambled screen for my troubles. None of the winning screens seem to be formatted for my screen..I end up with parts of pictures scattered all over and enevitably it bombs before it completes the end of the game. Pisses me off.

The same business that Microsoft is in? I liked the variety
and don't like to see old friends passed quietly into the
dark. (Where's Tina H.?) At any rate, Atari World is the
best replacement anyone could of possibly hoped for after
ST Reviews assimilation. Only a "Joker" believes resistance
is futile. :) (Gad, I've been reading between the type again).

My information came from over the phone line conversation
with Steve Cohen, about a 2 hour one, while we were discussing
the documentation in the Falcon Field Serivce Manual.
However, the last I talked to him was about 4 weeks ago. Seems
the specs have changed again. :)

I thought so. I just purchased a DiiMoCache 040/50mhz for a Quadra.
That is a 2X 25mhz 040. Next on the list is the 33mhz and the
Quadra 840AV and some Centris have 40mhz 040's. Haven't seen
a 66mhz (Yet).

>What's the price difference between an LC040 and "real" 040?

I'm not a coder, but have been told that FPU is handled a little
differently in the 040 than the 030. "May" be some problems there
for TOS software relying on an FPU in the 040, unless its recompiled
of course. :)

4213. enlarging the screen size on the sm124?

Newsgroup: comp.sys.atari.st
Date: 1995-09-20 00:00:00 UTC
From: lee@garnet.berkeley.edu
Message-ID: <43olau$drt@agate.berkeley.edu>
Source record: 158834

Recently, I was given the information that there exists a file out there somewhere in cyberspace (sm124.txt?) that contains the necessary information on how to enlarge the screen of the sm124. Well, I looked and looked, but I can't seem to find it anywhere. If any of you kind souls could give me a clue on where this file is, or how I can do this, I'd be eternally grateful.

My eyes thank you,
Lee

Probably yes. But you won't get two mouse pointers on the screen -
you'd just be able to control the one pointer with both mice. This
probably won't work too well.

Regards,
--

Michael Grove <mgrove@owens.ridgecrest.ca.us> writes:

>I'm not a coder, but have been told that FPU is handled a little
>differently in the 040 than the 030. "May" be some problems there
>for TOS software relying on an FPU in the 040, unless its recompiled
>of course. :)
As I said, I have an 040. The 040 does not implement the full instruction
set of the 68882 FPU for the 030. However, it is normal for the operating
system to emulate the missing functions, so that code is not recompiled.
TOS does not have these emulations, AIUI. But (for MagiCMac) we have
an AUTO folder program that adds them.

4218. wanted TOS

Newsgroup: comp.sys.atari.st
Date: 1995-09-20 00:00:00 UTC
From: m.stekeleburg@student.utwente.nl
Message-ID: <43ouhj$pcq@driene.student.utwente.nl>
Source record: 158839

Someone gave me a 260st which didn't work, but it runs fine now...
The roms contain now TOS 1.00. Where can I get a newer version? I'm able to program eproms...

Because 260 st seems rare. It contains the print of a 520st, and the ram is expanded to 1mb.

Max

> Can it be recovered ? or do I start billing my sister for a new copy

You should be able to undelete it with Diamond Edge.
I believe there is an undelete function in Atari's old CHKDSK3 also, and there
are a lot of PD/SW programs that probably can do the job.
The only way to be reasonably sure of success when trying to undelete a file is
if you haven't saved any info at all to the disk since the mistake.

>for graphics applications. Is a Y jack possible?

Nope, a Y jack won't help. That would just ruin the signal. Let me give a small example of what's going on when you move the mouse sideways. Time ticks downwards in the table:

Tick Xa signal Xb signal
0 0 0
1 1 0
2 1 1
3 0 1
4 0 0 (cycle back to tick 0)

Having two mice mixing up the signals, you can see this would not work. However, you can put a serial mouse on the serial port. There are different protocols around, but the Micro$oft standard is a 3 byte packet per movement at 1200 baud, 7+1. The bytes are: data, x, y, where x and y are the number of ticks the mouse has moved in each direction. The data byte contains extra bits for x and y, plus the mouse button states. The 1200 baud gives you 150 bytes/sec, which ultimately gives you 50 packets, so you will get a 50 Hz update on the mouse.

Yep, it is... You have to switch around all the x1/x2 y1/y2 wires (or whatever they're called). I can't remember it now because it was quite some time since I did it. To find out which wire to connect where I made a small program in GFA that showed how the pulse-sheme was..

Not as such, no; There is, of course, a joystick socket; It would be possible to
put a mouse in there, and write an event handler to run a second mouse.
I've never seen it done, but I can see how it would be possible.

It isn't easy unless you're an experienced programmer, & I doubt if it's been
done. You'd need different cursor bitmaps too!

ISTR that double sided drives were available from the start - and if STFs
were ever shipped with single sided drives then they stopped doing it
very quickly. The first one I saw was in June 1986 and it had a double
sided drive.

> The 2.5 Mb configuration needs a software fix in order to work. The

Only on STEs. STs could cope with 2.5Mb no problem.

> only exception I know of is the Marpet Xtra-RAM board which allows
> the machine to be upgraded directly to 2.5Mb. They also make a board

Which is nothing to do with the fact a Marpet board was used - and
everything to do with the fact that the board was only used in STs (or
MSTs).

> SCSI and parallel. Azog has partially missed the point:
>
> Is there anybody considering or attempting to use the non-SCSI version
> (parallel) Zip drive with an Atari ST?

This has AFAIK been covered before. The bottom line is that the Atari's
parallel port is not up to the job. It doesn't have all the lines necessary
to make PC style parallel devices work.

An interface could be made. There is a card which fits the cartridge port
which allows a parallel DE600 pocket LAN adaptor to be used with an Atari.
A varient on this interface could almost certianly be used with the ZIP.

However considering that many Atari users already have SCSI interfaces and
the SCSI ZIP is much faster - then I don't see anybody spending the time
or money to develop a special parallel interface.

> I currently own both an Atari 520ST without a hard drive (or SCSI
> adapter) and a 486 PC-compatible with a large hard drive but no

I'm in a similar position except I have fitted SCSI host adaptors to both
my Ataris and my PC. This way when I do get SCSI ZIP drive I'll be able
to use it with everything.

I've not tried it myself - but MiNT-Net has a wiring diagram/drivers for
a parallel port connection. Its not going to be compatible with an PC based
design due to the workarounds on the control signals - however AFAICR it
doesn't require borrowing lines from other interfaces.

:-)

Because of the memory architecture you can only go to 1Mb or 2.5Mb if you leave the current memory intact.

It may be worth looking at the PCB to see whether there are marked positions for an extra 16 chips which would get you to 1Mb at the cost of 16 chip sockets, 16 chips and a bit of patience with a soldering iron.

Otherwise, if new prices amaze you, you should look out for used RAM expansion boards (Frontier, Marpet etc.) when you ought to be able to get up to 1Mb for around $50.

You wrote:

> The drives themselves are called "PrairieTek", and the model is
> "Prairie 120", which I assume means 120mb (a far sight better than
> 85mb that I have now!)

As I've worked a lot with repairing Amiga computers, I've come across the PrarieTek drives in those. They are the only ones that have been used by Commodore that require a special cable, so I believe that the drives you have got might need the special cable too...
I know that some of the leads were twisted, but I don't remember how or which ones. All other drives work with a normal cable, however.
If I come across another one, I'll check it out and send a connection scheme to you.

Best regards,

Claes

Hi,

I've decided to sell my 6 month old Falcon030. Unit is still under the 1
year warranty. The unit is unmodified.

Falcon030 :

68030 CPU 16mhz
4 meg RAM
65 meg internal IDE hard drive
Mouse
2 Video adapters : 1 for Atari monitors and 1 for (S)VGA
All manuals and diskettes that originally came with the unit.
MultiTOS, Atari Works, SpeedoGDOS, Breakout, Landmine....
Original Box and packaging

Asking $700 or best offer.
Please E-mail me or call 216-729-0761 eves 7:00 - 10:00

I am relatively sucessfully using OASIS 1.33 (NOS). A prety complete package minus a graphical web browser, coming soon aparently. I FTPed it from disabuse.demon.co.uk (158.152.1.44). It's easy to set up, works with GENEVA and uses a GUI.
He may also need HSMODFX if he is using a modem faster than 9600. Any questions, feel free.
Rob

4242. SOFTWARE PACKAGES FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1995-09-21 00:00:00 UTC
From: rhett@bigwpi.WPI.EDU
Message-ID: <43sh9h$r0e@bigboote.WPI.EDU>
Source record: 158713

well, nobody wants all this separate so here are some nice package
deals. prices include shipping

BEGINNER'S PACKAGE: $25
for users of older machines with not a lot for them and not a lot to
spend on them: some basic basic stuff to get started.
these are all original disks, no docs or boxes, but easy enough to
figure out and some of them have on disk docs.

Turbo ST 1.4- old version of warp- screen acceleration is a must have
Copy II- disk copier, old and sturdy
First CADD 1.0- basic 2D CAD, easy
A-RAM- you must have some RAM disk, it is the law
Lots of ST Format, ST Xpress, Compute ST, and STart disks (with
various useful games and utilities)

GAMES PACKAGE: $20
oldies but goodies.

Red Storm Rising - box, docs
Populous I - the first God genre game, box, docs
Kings Quest - if you dont know, you are way too young, just the disks
Universal Military Simulator I - docs, flexible, revolutionary,
classic

WORD PROCESSING PACKAGE: $20

Word Up - includes dictionary and thesaurus, box,docs, needs 1 meg
G+ Plus- much better than GDOS, docs

GENERAL PRODUCTIVITY: $15

Revolver- set up virtual machines, a switcher, just disk
HippoArt I - some art for use in documents, etc
WERCS Resource Construction Set- a weird hypertext/relational database
sort of thing, just disk
Mega Check 1.22- check manager, printer

TELECOMMUNICATIONS PACKAGE: $10
all just disks

Flash 1.5 - popular for a long time, solid
UNITERM - terminal emulators
Interlink - again, old, but here it is

CYBER CAD ADD ONS PACKAGE: $25

Cyber Texture- texture mapper, docs,disk
Cyber Sculpt- 3D object modeller, docs, disk
Cyber VCR- link sequences on sony beta vcr's, cable, disk, box
CAD 3D developers disk- write your own addons, just the disk, docs on disk

if interested, just email, if anybody wants all of it for say $75, shipping inclusive, that would be great.

rhett@wpi.wpi.edu

>pins 41-44.

the last four pins are usually used(AFAIK) to denote whether it is a
primary or secondary drive, as IDE at that time anyway, could only have
two drives attached to the controller, and one had to be the primary.
good luck.bonne chance

I use Geneva myself, and find it runs fine. I have 4 MB RAM, but Gribnif has
come out with a "stripped-down" version of Geneva that provides multitasking
on low memory (<4MB) systems so if you are low on memory that would be the way
to go. write them at gribnif@genie.geis.com

The first thing to do is try and get a new DMA cable. This is the #1 cause
of read/write failures of drives that worked OK before. Occasionally
A cable breaks inside and gives a weak signal. Quantum drives usually
last forever so its probably not the drive.

Sorry but I don't believe that anyone makes a differential host adapter for the Atari computers.Most people I know usually avoid those drives as they are not mainstream.
I suppose one could hack out an adapter to convert single ended to differential but there would need to be a very good reason to make it worthwhile. :-)

On 19 Sep 95, Martin Rossel shot this through the ether to Tom Thomason...

MR> What leads you to believe that Wizztronics will get it together this time
MR> ? The Barracuda was firstly announced for release around two years ago.
MR> They've almost broken Atari Corp.'s world record in delayed releaseing !
:-
MR>) Do you know what we don't ?

Steve told me last night that the Hawk will be out at the end of October and that the Barracuda is on track and will be released on time. The price of the Hawk now includes the Fast RAM uppgrade board (up to 80Mb in addition to the basic RAM). New price in the US is US$699 excluding tax. I have a few more details that I can't release at the present time.

Mvh,
Tom

Don't tell me they needed to release 1,2 and 3 versions for the ST, before
beeing able to release a Falcon version. I simply don't believe this.

>waiting ages for Windows 95. It looks like MicroSoft eventually decided to
>rush out a nearly bug fixed version instead of waiting just that little bit

>many people think that it would probably be excellent if it installed, didnt
>need 16 meg and a P90 to get any kind of speed, didnt produce GPF's every
>five minutes........

Ahmm, you may want to change some of your statements if you knew the real
story about MS WIN95. First of all, MS promised an release in 95. Well,
we're in 95 now, i hope. Second, WIN95 as it is today is _not_ free of bug's.
Infact there is several bug's. I have been told, they already have a bugfix
ready, but because they want to earn money on that as well, it's not
going to get released until christmas. Thats tough business!
About the speed, thats just typical MS and PC's.
But never than less, i hope MS Win95 doesn't have anything to do with
Magic. Because others are stupid, it doesn't mean the rest have to be
as well, (or does it?).

>
>If you want to use MagiC on the Falcon, why not get the ST/TT MagiC and the
>Falcon patches available by ftp - you would at least have a decent and

>

But this will force me to buy Magic twice, as i doubt there will be an
upgrade. No way, i'm waiting, (untill i run out of patient), and then
see what happens.

4251. Release of OASIS 1.34

Newsgroup: comp.sys.atari.st
Date: 1995-09-21 00:00:00 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <811712870_OASIS_@yeadontt.demon.co.uk>
Source record: 158722
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,demon.ip.support.atari

As of 23/9/95 I have uploaded OASIS 1.34E onto the Demon and Hensa FTP site.

From version 1.34 and onwards OASIS is now shareware. Anybody who wishes to can now pre-register OASIS for the fee of 10 UK pounds.

Pre-registered users will recieve a discount of 10 UK pounds when OASIS 2.0 is released.

Everyone who pre-registers will recieve confirmation by E-Mail, in addition pre-registered users will recieve regular updates on progress with OASIS 2.0.

Send all cheques/international money orders (made payable to Mr P. Yeadon) to:-

Mr P. Yeadon,
29 Bolton Street,
Reddish,
Stockport,
Cheshire,
SK5 6BE,
England

Please include your Name, Snail Mail address and E-Mail address.

Just to add a bit of fun to all this, the FIRST UK and FIRST International user to pre-register OASIS 1.34 or above will recieve the full OASIS 2.0 package FREE when it is available!

Here is a summary of the changes from version 1.33E to version 1.34E of OASIS
OASIS 1.34E

Bug fix for Forward As E-Mail if News articles, it is now possible to select an E-Mail address from the Yellow Pages. Previous versions appeared to 'lock up' if this was attempted.

Bug fix for viewing News and E-Mail items on greater than 640 pixels wide. The text no longer 'escapes' from the right hand edge of the window.

OASIS now checks that there is enough hard drive space before it carries out major taks ie Unbatch news, Index new mail, expire newas and mail etc.

4252. Mega ST4 setup - Help!

Newsgroup: comp.sys.atari.st
Date: 1995-09-21 00:00:00 UTC
From: david@bay-tree.demon.co.uk
Message-ID: <811810997.284@bay-tree.demon.co.uk>
Source record: 158723

Apologies if this is some sort of naive FAQ and its posted in the
wrong group, but my brother has been given an ST4 setup as follows:

Mega ST4
SupraDrive Atari 30 MB
Laser printer driver controller SLMC 804
Laser printer SLM 804

- however he lacks some of the documentation, and we're not quite sure
how it should all be connected together (some sockets not being
marked).
I'd appreciate info on how to interconnect these units (ie which
sockets to which)

Many thanks in advance,
David C. Lovatt - G7UHK (2m & 70cm)
Highgate
London
England

4253. Q: program to make graphics/stats

Newsgroup: comp.sys.atari.st
Date: 1995-09-21 00:00:00 UTC
From: maberg@xs4all.nl
Message-ID: <3064a81e26f8ac20@xs4all.nl>

Source record: 158778

Andrew tried to reply to your message but got an unknown user so will put the info here. You can use your pc at work to get the file you need provided you use Double density format on the disk, your ste will then be able to read it. You should be able to find st tools on Umich but it is often easier to go to Phoenix.doc.ic.ac.uk into the atari/umich mirror site. The reason your pc can't read the st disk is because it will use and extended format like 82tracks and 10 sectors though I believe some pc formatters and toolkits can work with these the standard system can't. Hope this helps

From: koeves@sunserv.kfki.hu
Message-ID: <43rcuc$2mf@sunserv.kfki.hu>
Source record: 158782

Help, I am searching for information on an Atari laser printer SLM-605.

My question is: Is it possible to use this kind of printer with an IBM PC
(clone) computer.
I need technical information on the printer (whether that is usable on a
parallel or serial port, cable pinout description, and so on).
I would appreciate also information on where to find such an information.

I am waiting the answers to my e-mail address:

koeves@sun60.mszki.kfki.hu

Yours sincerely:

Koveshegyi Laszlo

I don't have any schematics for these, as that would mean pirating hardware and
I would never try that, but the price you mention seems high.
Here in Sweden, the SoundPool S/P dif's are sold at SKR2400, which is about
US$335. Maybe you could order it here to get a better price?

Best regards,

Claes

> It's the fastest multitasker OS avaiable for the Atari.

Personally I use the AES4.1 version of multiTOS, with MiNT and MiNT-net, it gives
a wonderful level of internet access (which is what I use it for - in fact,
I'm typing this in a telnet session in a GEM window, whilst running a couple of
DUftp sessions at the same time).

For general use, I'd wait for the next version of Geneva (which will run on top
of MiNT in much the same way as MultiTOS) - then you get all the nice bells
& whistles that Magic is missing, and the top b*llock networking that MiNT
provides.

Craig.

Dear Annius,
I am interested in what Atari has to sell. What do you have
and how much? I am interested in a portfolio. I own a Falcon and Jaguar.
I live in Den Haag and work in Groningen.

are
> $500.00!
> If you have the plans for sale I will buy them. Thanks

No they are not!
There are three interfaces on the market:
- one from Catch-Computer
- the FDI from SoundPool (about 500DM)
- P_S_I from BlowUP (448DM including BlowUP030 Soft-only, P_S_I BackUP -
Backup
software for all files on Dat, and a IR-remote
control)

for the latest one refer to
acher@informatik.tu-muenchen.de (they now accept orders by credit-card)

If I remember correctly, Imagecopy is a GEM program and therefore I
can't use it to take snapshots from games (that don't use GEM).
Besides, I need a PD program, because I need only few snapshots
for Finland's ST club's disc magazine. In other words, I don't
want to pay for it :).

Thanks Dan,

someone emailed me with the same idea, I think ST-Tools sounds like my
best bet, but can you give me a URL, as a need to download the program
onto my PC at work, then copy it to a DD Disk and take it home for use
on my ST.

I believe this will work as the ST is fairly tolerant at reading MS-DOS
formatted disks.

Thanks again,

And. :-)

4271. TT030 Questions

Newsgroup: comp.sys.atari.st
Date: 1995-09-21 00:00:00 UTC
From: ap748@cleveland.Freenet.Edu
Message-ID: <43ru03$7e7@usenet.INS.CWRU.Edu>
Source record: 158795

Hi,

I am interested in getting an Atari TT030 computer. I've read about them years ago in magazines but I have never had a chance to use one. I have a few questions about the TT.

1. I know that there are two types of user RAM ST and TT.
I assume through the desktop or CPX I am able to control which RAM to use?
If I run a ST program in TT RAM will the program run or do you need native TT programs to take advantage of TT RAM?
2. I saw that the TT has all standard ST ports. Can I use my ST DMA devices like a SLM804, hard drives, Super Charger...?
3. Does the TT have an internal Hard Drive adapter? If so can I just plug in a SCSI drive and go or do I need an ICD host for an internal drive?
4. What kind of monitor can I use with the TT? SC1224, SM124, VGA, Multisync SVGA? do you get adapters like the Falcon to match whatever monitor you wish to use? I am aware that a Moniterm monitor is required for TT high resolution.
5. Is ST software compatible with the TT? Or is the properly written type that will only? I know that the Falcon is about 50% compatible with ST software does the TT have the same type of compatibility problems as the Falcon due to the 68030 chip?

Cool -- I was planning to install Linux in the very near future anyway!
How compatible is STonX? I am mainly interested in applications, not
so much in games.

>You just have to provide the operative system yourself...

No problem -- can just read out my ROMs of my old machine.

Thanks for your help!

On 19 Sep 95, David Stevenson shot this through the ether to Tom Thomason...

>> Barracuda is a 68040LC card with a CPU speed of 66MHz.
DS> No, they don't make them that fast, it's 33MHz.

The 66MHz figure is double-clocked in the same way as Intel release "double-clocked" figures.

DS> What's the price difference between an LC040 and "real" 040? Power-
DS> users may well want an FPU, ie full 040. I have to change the processor
DS> in my Mac for this reason.

According to my dealer's price list the difference is US$150. The only problem
with using the full 040 card is that the address fro the FPU also changes which may lead to problems with some software. The LC040 should be able to use the standard FPU AFAICT.

Cheers,
Tom

4281. External ST SCSI Hard Drive Setup

Newsgroup: comp.sys.atari.st
Date: 1995-09-22 00:00:00 UTC
From: cb092@FreeNet.Carleton.CA
Message-ID: <DFB7DI.KGH@freenet.carleton.ca>

I'm selling a nice external SCSI hard drive box
with or without a 20mb hard drive installed.

The box itself is Atari gray and has about the same
footprint a standard Atari colour monitor (it nessles
neetly under on of these units). It is about 4" tall.

The case has an internal power supply, fan and two bays.
Bay one holds the hard drive (any standard 3.5" SCSI
unit). Bay two is already populated with a 3.5" DS
floppy drive, supported by a standard Atari controller
(also installed within the box).

Priced to sell a $145 with both drives installed (20mb
hard drive plus 720 floppy or $120 for case with the 720
floppy only. Standard Atari floppy cable is included,
but buyer will need to separately acquire LINK 2 SCSI
cable.

4286. AtariNet!

Newsgroup: comp.sys.atari.st
Date: 1995-09-22 00:00:00 UTC
From: Terry.May@rebel.genesplicer.org
Message-ID: <30b_9509230202@genesplicer.org>
Source record: 158660

You're invited to AtariNet, a very friendly Fido technology network (ftn) dedicated solely to Atari machines. Perhaps you've read about us in Atari Explorer Online.

We have many message areas to discuss issues related to Ataris, as well as several support areas for various programs, and one general area for everything else.

We also receive a full feed of the FAN (Final Atari Network) file echoes. FAN is often the first place to find new files, many times direct from the authors themselves, especially for European programs.

All that you need to receive all of this is ftn-capable software (widely available) and an Atarinet address.

If you'd like more information about AtariNet, please contact me at Terry.May@rebel.genesplicer.org, or you can contact one of the following AtariNet coordinators:

```
Coordinator FidoNet # BBS number Location
------------------------------------------------------------------------
Bill Scull .......... 1:363/112 .... 407-831-1613 ...... Longwood, FL
Terry May ........... 1:209/745 .... 702-435-0786 ...... Las Vegas, NV
Al Petersen ......... 1:278/210 .... 718-833-0828 ...... New York, NY
Don Liscombe ........ 1:229/100 .... 905-683-3089 ...... Ajax, Ontario
Kevin Osborne ....... 2:254/105 .... 44-181-244-9825 ... London, England
Frank Brodmuehler ... 2:2450/565 ... 49-2236-942080 .... Cologne, Germany
Barry Torrance ...... n/a .......... 403-436-0328 ...... Edmonton, Alberta
Rick Nolan .......... 3:712/520 .... 64-3-389-6178 ..... Christchurch, NZ
Herve Piedvache ..... 2:320/107 .... 33-1-42511135 ..... Paris, France
Dirk de.Vos ......... 2:282/704 .... 31-5610-15121 ..... Wolvega, N'lands
```

If you're already running a FidoNet BBS, you can file request the AtariNet starter package from any of the above addresses, using the magic filename of ATARINET.

Note also that there are dozens of nodes in various locations under each of these coordinators. Your best bet is to contact the coordinator closest to you and he can tell you if there's anyone closer to your specific location.

We'd really like to hear from you and make you part of our growing family!

* LED v1.31 * FidoNet SysOps: Please Freq ATARINET @ 1:209/745!

KM>to 9pin/15pin) but I am unclear on how to configure for the lan port.
KM>Does anybody have an idea? Any help much appreciatted! VVPPT

Yes, its possible to connect a modem to the lanport with an adaptorcable and the right software. That's how my modem is connected to my falcon. Oh yes, the software. I am using HSMODEM 6 and CoNnect and this combination works perfectly allright.

A giant chicken in the guise of Oliver Steinmeier clucked:

> Cool -- I was planning to install Linux in the very near future anyway!
> How compatible is STonX? I am mainly interested in applications, not
> so much in games.

It works great with applications, but: You currently are limited to the three standard ST graphics modes. (with the STe 4096 color palette) The VDI driver will eventually allow you to use whatever resolutions your Xwindow monitor will support.

> >You just have to provide the operative system yourself...
>
> No problem -- can just read out my ROMs of my old machine.

NOTE: STonX currently works only* with TOS 2.06. I have yet to hear from anyone getting any other versions to work.

From: sirsmedley@delphi.com
Message-ID: <x-PAmeB.sirsmedley@delphi.com>
Source record: 158729

Just another reminder about our upcoming Atari show! The Atari Users of North Texas will be hosting an Atari computer show which we have cleverly named DEUCE on October 7th. The event will take place at the Infomart in Dallas from 8am to 2 pm. Yeahm I know, short hours, but that is out of our control. The state fair is the same weekend, in case you would like to do something as well as the show. (In fact, $8 gets you into the fair and you can see the Beach Boys for free Saturday night!) This is only a couple weeks away now, so make your plans! And of course there is Six Flags to visit, and the historic distric downtown. Bring the family, there is plenty to do here! We even got a Ripley's Believe It Or Not museum and a house of wax. (Yeah, we are a certifiable cultural center!)

4298. Diamond Edge V2.02 Buggy?

Newsgroup: comp.sys.atari.st
Date: 1995-09-22 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DFAoMF.Du3@ridgecrest.ca.us>
Source record: 158732

I just purchased a copy of Diamond Edge from Toad.
The install program worked fine. Once EDGE is started
and the main menu is available, some of the option
boxes are distorted, and when closing the menus
the redraw of the windows is not proper. I tried removing
all acc's and autofolder programs, and ST med to Falcon
VGA in various colors. I even renamed my Newdesk.inf
in case it was bad. Same problem. Selecting any drive
other than A for EDGE to save it's files to causes the
machine to crash big time. Needles to say I removed it
from my harddisk. It looks like it could cause some
big problems.
Anyone else have this problem?

Mike

I'm currently experiencing the same problems. However, I have managed to confirm, using a friend's ST, that the HD is OK... Seems the problem is in the ST itself. The ST has been examined by professional repair persons, but they could not discover anything wrong with it (probably because the problem only occurs when the computer has been turned on for some time and is warmed up). Any info on where to look for faulty hardware, would be appreciated.

| No, only Netscape, because it defaults to .au files, and afaik the others
| dont do this unless you have external client software.
^^^^^^^^^^^^^^^^^^^^^^^^
AKA a helper app, which is what I said.

| Lynx does not have any facility such as this.

You can specify a .au/.wav/.whatever player as a download method in lynx.cfg. True, it won't be automatic the way it is in a GUI browser with images enabled and <IMG SRC=rolf_harris.au>; the user will have to hit a key.

(BTW the only .au I could find in your home page was your email address. I didn't try to listen to it ...)

While we're here, does anyone know where to find a sound driver for MiNT on ST or Falcon?

When I experience the problem, and the file could not be written after 40
attempts, I get a 'Sense $04', which, according to the ICD documentation means
'Drive Not Ready'.
My current hypothesis is that there is a chip, which buffers the DMA port from
the actual address and data buses, which gets over-heated. Gonna see if I can
find a chip that is very hot, and if there's a thermic resistor near it which
may be broken.

We like the slogan "Knocking Off The Competition" also. Its all in fun and it makes the day at work very interesting. If everyone here enjoys working and takes pride in the company, we will be in business for some time.

Our white collared shirts we had printed up has our logo on the front breast and the "Knocking Off The Competition" on the back in big letters. When I walk down the street or go to computer shows, we turn lots of heads and get good remarks. We sell our shirts too and people just like to buy them for the fun of it all. We are having fun!!

Thanks for the remarks and I enjoy getting feedback like this.

Tom Ferreira

4310. Help, Atari printer SLM60

Newsgroup: comp.sys.atari.st
Date: 1995-09-22 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <950922000008191 29@acpu.com>
Source record: 158744

"31" hung dis in da group:
3 > Help, I am searching for information on an Atari laser printer
3 > SLM-605. My question is: Is it possible to use this kind of
3 > printer with an IBM PC (clone) computer.

From what I am told, the answer is...
no.
Atari Laser printers were designed to be "dumb". They use direct
memory access, and let the computer's brains do the thinking for
them. Since pcs and Macs require fairly "brainy" printers, the
Atari SLMs won't work with them.

4311. HELP! I blew up my friend

Newsgroup: comp.sys.atari.st
Date: 1995-09-22 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <950922000008191 30@acpu.com>
Source record: 158745

"Jim McMahon" hung dis in da group:
JM> HELP! I blew up my friends Atari! I won't boot I ran Diamond
JM> Edge on a friends Atari to fix some hard drive problems (I
JM> know NOTHING at ALL about Atari). The program found a lot of
JM> problems (it also filled the C drive up...is this a part of
JM> the problem???). Anyway, now it just BOMBS (4 bombs). I got
JM> it to boot once from floppy (by holding down Alt or Ctl or
JM> something), but then the hard drives do not show up!

There are plenty of people in this group who can help you more than I can, because they have done this to their own hard drives. Just like me. But here is the help I can give.
If you filled up the C drive, the whole drive may be unrecoverable. There is a bug in TOS (the operating system) that will write one sector past full (so I am told, so I believe) on any disk, hard or floppy. Usually ends up in the boot sector, either of C or of one of the other logical drives. Catastrophic, usually.
Here's how to find out how bad it all is. Boot from floppy, by holding down Alt when the A drive light comes on, until you are staring at the desktop. This is not a universal, but is the way to do it with Atari hard disk utilities for the ST, and probably with what your friend has. (See "bypassing the hard disk driver" in the manual.) Then you can install a "C" drive icon in the "Options" menu. (Make sure that the floppy you boot with has no "ahdi.prg" in an "auto" folder. I ordinarily use a floppy with nothing at all.) Then run AHDI.prg from the desktop, from a "hard disk utilities" floppy disk. You can then take a look at each drive (by installing icons for each) to see if the contents can be recovered.
If I get to this point, and cannot read the disks' contents at all, it's re-format time. Life in the big city. You may be able to work some magic to recover the data, but all the wizards here just shake their heads and moan.
The "language disk" just has ST Basic language, a sample program, and a couple of desk accessories. No use to you in your present predicament, and not much use later, IMHO. It is _not_ a system disk ala MessyDos or Mac. Atari ST operating system is entirely in ROM.
Hope this helps!

"The Poor Deluded Soul"
tderrick@acpu.com

... Does "Bad FAT" mean this disk has high cholesterol?

Hrafnkell Hlodversson <freyr> wrote:
>What about plugging another mouse into the other joystick port?

Been there, did that. ;^)

It only "partly" works. The ikbd has not been programmed to allow a mouse in the joystick port, and you only have 128 bytes of RAM, so you can't do it yourself. The next best thing is to let the 68k keep track of the signals. However, the signals don't come fast enough, so unless you move the mouse very very slowly, it won't work.

Alternatively, you could reburn the ROM of the ikbd. Unfortunately, I don't have any documentation on the CPU Atari uses for the keyboard, and you'll probably have to increase the clock frequency a bit. You'll also have to alter the ikbd protocol a bit, meaning you'll have to rewrite the keyboard routine as well. But apart from these tiny problems, it's not an impossibility. ;^)

4315. WEB SERVICE :)

Newsgroup: comp.sys.atari.st
Date: 1995-09-22 00:00:00 UTC
From: ade@adesamm.demon.co.uk
Message-ID: <811799026_OASIS_@adesamm.demon.co.uk>
Source record: 158749

Offered to everyone, a new unique WEB Service that doesn't need any Web Software, or even an internet connection, or computer.
Send an SAE to me and I'll send you back the home page of your choice.
Please note due to limitations, (I've only got 5 crayons) pictures will only be seen in a few colours, and much less detail than on a normal connection, (I'm not a very good drawer either!).
Once you have this send me back details of which link you wish to follow and I'll post back (snail mail of course) the next page.
With this NEW SERVICE! you could be surfing to that vital info you want in a matter of months, (if your lucky)

Please send all enquiries to:-
Web snail mail service,
P.O. Box 1

P.S. please don't ask for pictures with to much red in them as my red crayon is getting rather blunt.

(Anyone who's read this far and still wants this service please bang your head against nearest hard surface :-)

4317. Atari cartridge port

Newsgroup: comp.sys.atari.st
Date: 1995-09-22 00:00:00 UTC
From: Timothy Miller <millert@csee.usf.edu>
Message-ID: <Pine.SUN.3.91.950922163906.9204A-100000-100000-100000@scheifler>
Source record: 158751

I need to know where I can get something to interface between an Atari ST's cartridge port and a project I'm working on. Just the card interface and something that I can solder to or wire-wrap for now.

Also, I need to know how much current I can draw from a Falcon's cartridge port.... I understand that the Falcon's power supply already does not produce enough power. I just want to know if the Falcon can support a Z-80, 7 serial chips, RAM, and and EPROM connected to the cartridge port.

Plus, if anyone can direct me to appropriate newsgroups where I can discuss the Z-80 and to companies from which I can order chips and databooks, it would be appreciated.

Thanks. Also, I would prefer that you respond to me in email.

The rather crappy software that came with the scanner only allows TIFF,
PICT and MacPaint. I've heard bad things about TIFF, I dunno if I want to
fool with it...;) MacPaint is greyed out half the time, I assume because
the format doesn't support the 1000x4000+ pixel size I need... oh well,
I'll have to see how TIFF works out... (btw: I'd still find it very*
usefull to be able to use IMG files with PhotoShop...)

How compatible and reliable is STonX? Since I already have a Pentium
notebook, and since I need it to run OS/2 (and soon Linux), switching
to a Mac is not really an option for me.

: I just purchased a copy of Diamond Edge from Toad.
: The install program worked fine. Once EDGE is started
: and the main menu is available, some of the option

I have Diamond Edge, and haven't experienced any of those problems on my Falcon. I also use a VGA monitor and have Edge installed in a nested folder on drive C, and save all my Diamond Mirror files there. The only objection I have to the program is that the icons on the bottom of the screen don't look very attractive with my pallette, and I don't know of any options to edit them.

From: mparrott@kendaco.telebyte.com
Message-ID: <440i3e$md6@news.telebyte.com>
Source record: 158670

I've been attempting to use Breakthru 2 as an editor for a MIDI drum machine (Alesis SR-16, if it matters) and have been a bit disappointed with it's built-in Drum Editor screen.

Would anyone out there know of a PD/Shareware/Commercial bit of software that's TT030 compatible and makes editing drum patterns relatively easy?

Thanks for any input,

I found these problems within 24 hours of Civilization going on sale. I ended up sending my end games to Microprose so that they could see the problem (so much for sodding QA!). I got a new set of disks which were still flawed. I sent another disk - got another set back. Still problems : rang them again - got another set of disks. These played OK but when you launched the ship to Alpha Centuri the screen displayed was still fucked up.

I gave up ringing Microprose then as they obviously didn't care about the Atari Market which was pity because Civilization is quite of good game - its just a bit too "samey" all the way through.

Railroad Tycoon was a much better game (unless you wanted to run more than 32 trains or have more than 32 stations!)

Jim McMahon (jimmc@primenet.com) wrote: : I ran Diamond Edge on a friends
Atari to fix some hard drive problems (I know : NOTHING at ALL about
Atari).

There is no worse feeling that trying to do someone a favour and STUFFING
IT UP COMPLETELY :-(Been there, done that.
:
: The program found a lot of problems (it also filled the C drive up...is
: this a part of the problem???).

The first rule is...Back up everything first..(Well, next time anyway).
Don't worry yet about those weird files in C drive, hopefully there is a
boot disk around somewhere so that then you can access the hard drive again.
Delete these weird files later if you get access.
:
: Anyway, now it just BOMBS (4 bombs). I got it to boot once from floppy (by
: holding down Alt or Ctl or something), but then the hard drives do not
: show up!
If you are using an ICD boot disk, press A heaps of times to try to
get it to boot from floppy drive A.
If this works, higlight a disk icon, go up to 'Instal a disk drive' and
install a C drive. Do the same for other drives. Use the utilites program
to make it boot from C.
:
: PS: What is the language disk?
:
Forget that.

Good luck.......:-)

Why should we do YOU a favor? I'm sure there's some group that specialises
in whatever kind of machine you prefer, why don't you go there, and never
come back? I've seen and used several different computers, and I prefer
by a VAST amount, the Atari. If you're using MessyDOS, you're paying
homage and money to the richest person on earth. The only viable way to
pursue computing without helping Kaiser Bill to control the minds and
wallets of all civilisation is to buy an Atari, and use it to do
something useful or entertaining!

From: hellman@teleport.com
Message-ID: <441u06$h7t@linda.teleport.com>
Source record: 158684

Hello All,
Does anyone know the whereabouts of Steven J. Pagliarulo? He wrote Analyze, the ST spreadsheet program back when the ST was brand new. He apparently wrote this whole Lotus clone himself and did a rock solid job. I just used it last night and was impressed with his early complete programming (including making his own item selector and using the TOS clipboard function).
The program has a few mouse problems with later TOS, but otherwise has completely stood the test of time. It would be nice to thank Steve for his work and check about the mouse stuff.

Not necessarily; it's been "coming soon" since Oasis was launched back in
April. The authors are currently working on the dialler so presumably all
the difficult stuff (i.e. everything else) has still to be attemped.

From: markvanwyk@aol.com
Message-ID: <4426fd$8jv@newsbf02.news.aol.com>
Source record: 158696

I have heard a RUMOR that it is possible to get Atari ST/STe access - TEXT ONLY - to the World Wide Web by subscribing to CompuServe. I tried subscribing to CompuServe, and I can't figure out how to get access to the Web. Can anyone out there tell me IN PLAIN, SIMPLE TERMS, what one needs to do to gain text-only World Wide Web access on Compuserve with my Atari Mega STe using Flash telecommunications software?
(I envy Mac and PC users who can load America On-Line's newest software. Talk about quick and easy access to the Web! I have AOL using my Atari by using the Spectre mac emulation, but I can't use the newest AOL software, which has an excellent Web browser, because it requires System 7 or above.)
Any help that anyone can offer me to get me going on accessing the Web (text only) with Compuserve would be greatly appreciated.

hello there loyal but stupid user.....when I made that program, the ST was brand new - since then things have changed, and you should change with them. Buy a new computer. You know that the ST is looking seriouly dated now, so upgrade. If you really cant let go of the dire ST software then buy a macintosh and get an st emulaor for it. But if you really think about it, you should invest in something like a pentium.....but thank you for remembering me....I must be going, have fun ;-)

If you have an ST (but not an STE), you should get it fitted with OverScan
and really make use of the screen. It is the normal resolution, just
bigger.

Cheers,
Mike.

I've heard about here but have seen nothing. Just setting here thinking
about it, I would think it would be possible but it would involve a LOT of soldering.
You would have to add a 50 wire ribbon cable to the back side of the existing 50
pin connector so it could be run out the rear of the ST. Patch the external SCSI
drive for ID 1, connect power and go.
I've only seen and installed one of these internal SCSI controlers and
that was a ICD one. I wouldn't think they would go to the trouble of removing
the support for multible devices. Oh, yes, be sure to remove the terminators
from the Internal HD and the External is Terminated.

Do you need any particular format. I have a small program which i wrote
to grab screens from Falcon resolutions. It grabs in a raw data format
much like Degas Elite format of long ago, Just pallette information
followed by screen data. It works by using the ALT+HELP keys.

Max Farina (massimo@irfmn.mnegri.it) wrote:
: Any discussion on CaTTamaran ?
: I would like to buy it but I would like to know some experience of TT users...
: Have you compatibility problem using this card ?
: Thanks

The card seems to be a little tricky to install; harder than one might think.. =-(. It also seems to dislike some TT-motherboards; on one revision H motherboard we didn't get it to work at all reliably - on another, similar (!) unit it works great!

But once it sits comfortably inside one's TT, and one doesn't have trouble with Mighty Mic fast-RAM card (like we did), it works like a charm.

No compatibility problems so far.

I must say that the problems with installing are results from many slightly different TT-designs, not the CaTTamaran itself..

Greetings,
Tommi

> I assume through the desktop or CPX I am able to control which RAM to use?
> If I run a ST program in TT RAM will the program run or do you need native
> TT programs to take advantage of TT RAM?

Most programs should be able to execute fine in either ST or TT RAM. ST RAM
is required for most of the ST DMA operations. (I.e., the ST RAM is the only
kind of RAM that can be used for an I/O buffer. The DMA devices aren't able
to access TT RAM. The physical screen buffer also must be in ST RAM.)

>2. I saw that the TT has all standard ST ports. Can I use my ST DMA devices
> like a SLM804, hard drives, Super Charger...?

Yes. Dunno if the SuperCharger needs anything special to work, it may have
68000-specific code in its support drivers.

>3. Does the TT have an internal Hard Drive adapter? If so can I just plug in
> a SCSI drive and go or do I need an ICD host for an internal drive?

Yes, you can just plug in a SCSI drive. A 3.5" half height will fit fine. I
have a 1/3rd height drive installed right now.

>4. What kind of monitor can I use with the TT? SC1224, SM124, VGA,
> Multisync SVGA? do you get adapters like the Falcon to match whatever
> monitor you wish to use? I am aware that a Moniterm monitor is required
> for TT high resolution.

Yes, all those monitors will work. I think the TT connector is a standard
15-pin VGA type, so you'll need an adapter for using the older ST monitors.

>5. Is ST software compatible with the TT? Or is the properly written type
> that will only? I know that the Falcon is about 50% compatible with ST
> software does the TT have the same type of compatibility problems as the
> Falcon due to the 68030 chip?

Probably the same issues as the Falcon. Programs that use software timing loops
are definitely going to lose. (No excuse for that - every ST has always had
sufficiently useful hardware timers that this should never have been done. So
it goes.) Programs that explicitly access the BLiTTer will fail, since the TT
has none. Programs that use the 68000 MOVE from Status Register instruction
will get a privilege violation exception. (This can be accomodated by installing
an exception handler that carries out the desired operation and then returns
for normal execution.) Programs that explicitly access I/O registers using
24 bit addresses instead of 16/32 bit addresses may have problems. (Actually,
come to think of it, that shouldn't be a problem; the TT memory map already

takes that into account.)

>With a Mac? I don't think anyone has written an AppleShare-compatable network
>for Atari's yet. It would be very cool if someone did...

I dunno about that, AppleShare really isn't a very nice filesystem as network filesystems go. (I've spent the last 9 months of my life working on an Apple protocol stack for Unix, I'm not all that impressed by the protocols as a whole...) I suppose LocalTalk support would be nice, and a TT/Falcon/MegaSTe could probably handle it with no problem. But even Apple is on the verge of leaving AppleTalk behind; when they go to Open Transport they'll just use TCP/IP like everyone else.

I'm not using it, but I have played around with it. IIRC, the right
button, will, when you click on the desktop, bring up a menu giving you
the option to move/size/kill/exit. If this doesn't work, try editing the
.9wmrc file (I think that's what it's called), to remap the physical
mouse buttons.

Oh dear, what have we here ? A frustrated computer-user that is trying to
convince us PCs with their outdated design are better than Ataris !
ROTFL !

He is even a chicken too, he posted it anonymously ! Man you got real guts.

Let me tell you something. The fact that Ataris nowadays are underpowered
and overpriced compared to PC's doesn't mean they're not better computers.

Take a look at the price a 1986-made Atari costs second-hand and the fact
that they are still wanted. But who in the world would by a 1986-based PC ?
Not even $40 will you get for those 8086's, buddy !
The architecture of PC's is so bad it gets outdated at a much higher rate
as any other system available.

Furthermore, I recently had a coversation with someone on USENET who owns
a Pentium 90 with a 1 Gig EIDE harddisk. After exchanging real-life
benchmarks (copying a well-defined amount of data, 50 MB) the result was
that my 28 MHz Atari performed way better than his Pentium-PCI, no matter
what he tried (like 8 MB cache, other PIO-modes, etc.).
So maybe his computer has more computing-power, but what use is that if your
system is so badly designed it can barely get a thoughput of 250 KB/s to
your harddisk ?

And tell me how it is possible that with such a "good" system there is
as yet no way to record eight channel CD-quality audio simultaneously on
a PC whereas Atari Falcons have no problem with that whatsoever ?

Grow up, you fool, and start saving money to buy the necessary 16 MB and
2 Gig HD that will enable you to run W95, thereby getting about the same
functionality as we Atari users already have with 4 MB RAM.

The software is no problem. Use HSmodem. The hardware may be though, contrary
to what you say. Isn't the LAN port using TTL or ECL -level in/outputs ?
And RS232 works with -12V/+12V. You'll need a converter for that.

A 20 kHz model is still 30 % underclocked when driven with 15 kHz so the monitor
will come to a very premature end. Never run any monitor outside its specs,
neither higher nor lower. Manufacturers don't print those specs for nothing.

Oh no, not again ;-) !

Yes, ATARI developed the microbox SOME(!) years ago, right after the
Falcon was presented. unfortunately there was one design error, so the
machine was never sold.

Only incompatibility I have encountered so far was with a 32M upgrade
board for TT Ram - GESoft's board to be exact. Didn't bother trying
to chase down why the problem since my son was due to leave for school
the next day. Other than that, its been great. (It has the option
to slow it down if you need it.) Wayne Booth

: > midi-network packages.
: Try ST-TRANS from Atari, this works fine with a speed (here)
: from approx 15 Kb/s

: The speed is not extremely high but when running one computer is
: your slave and the other one does run as master.

: It needs a normal 25-p cable, only pin 1 and 11 should be crossed
: to let it work.

: Don't be affraid for your printer port, i've used it between ST,
: Falcon and STacy and i've also inserted the cable in my PC and
: everything does live like normal :-).

I can back this up, as ST-TRANS is the software ATARI supplied with the
ST-BOOK for data transfer to & from the BOOK, as it is not fitted with a
floppy drive. Oh, yes I have seen this working 1st hand...

Subject: [HUMOR] The Man from Microsoft

[original author unknown]

There was a knock on the door. It was the man from Microsoft.

"Not you again," I said.

"Sorry," he said, a little sheepishly. "I guess you know why I'm here."

Indeed I did. Microsoft's $300 million campaign to promote the Windows 95 operating system was meant to be universally effective, to convince every human being on the planet that Windows 95 was an essential, some would say integral, part of living. Problem was, not everyone had bought it. Specifically, I hadn't bought it. I was the Last Human Being Without Windows 95. And now this little man from Microsoft was at my door, and he wouldn't take no for an answer.

"No," I said.

"You know I can't take that," he said, pulling out a copy of Windows 95 from a briefcase. "Come on. Just one copy. That's all we ask."

"Not interested." I said. "Look, isn't there someone else you can go bother for a while? There's got to be someone else on the planet who doesn't have a copy."

"Well, no," The Microsoft man said. "You're the only one."

"You can't be serious. Not everyone on the planet has a computer," I said. "Hell, not everyone on the planet has a PC! Some people own Macintoshes, which run their own operating system. And some people who have PCs run OS/2, though I hear that's just a rumor. In short, there are some people who just have no use for Windows 95."

The Microsoft man look perplexed. "I'm missing your point," he said.

"Use!" I screamed. "Use! Use! Use! Why BUY it, if you can't USE it?"

"Well, I don't know anything about this 'use' thing you're going on about," The Microsoft man said. "All I know is that according to our records, everyone else on the planet has a copy."

"People without computers?"

"Got 'em."

"Amazonian Indians?"

"We had to get some malaria shots to go in, but yes."

"The Amish."

"Check."

"Oh, come on," I said. "They don't even wear BUTTONS. How did you get them to buy a computer operating system?"

"We told them there were actually 95 very small windows in the box," the Microsoft man admitted. "We sort of lied. Which means we are all going to Hell, every single employee of Microsoft." He was somber for a minute, but then perked right up. "But that's not the point!" he said. "The point is, EVERYONE has a copy. Except you."

"So what?" I said. "If everyone else jumped off a cliff, would you expect me to do it, too?"

"If we spent $300 million advertising it? Absolutely."

"No."

"Jeez, back to that again," the Microsoft man said. "Hey. I'll tell you what. I'll GIVE you a copy. For free. Just take it and install it on your computer." He waved the box in front of me.

"No," I said again. "No offense, pal. But I don't need it. And frankly, your whole advertising blitz has sort of offended me. I mean, it's a computer operating system! Great. Fine. Swell. Whatever. But you guys are advertising it like it creates world peace or something."

"It did."

"Pardon?"

"World peace. It was part of the original design. Really. One button access. Click on it, poof, end to strife and hunger. Simple."

"So what happened?"

"Well, you know," he said. "It took up a lot of space on the hard drive. We had to decide between it or the Microsoft Network. Anyway, we couldn't figure out how to make a profit off of world peace."

"Go away," I said.

"I can't," he said. "I'll be killed if I fail."

"You have got to be kidding," I said.

"Look," the Microsoft man said, "We sold this to the AMISH. The Amish!

Right now, they're opening the boxes and figuring out they've been had. We'll be pitchforked if we ever step into Western Pennsylvania again. But we did it. So to have YOU holding out, well, it's embarassing. It's

embarassing to the company. It's embarassing to the product. It's embarassing to BILL."

"Bill Gates does not care about me," I said.

"He's watching right now," the Microsoft man said. "Borrowed one of those military spy satellites just for the purpose. It's also got one of those high-powered lasers. You close that door on me, zap, I'm a pile of grey ash."

"He wouldn't do that," I said, "He might hit that copy of Windows 95 by accident."

"Oh, Bill's gotten pretty good with that laser," the Microsoft man said, nervously. "Okay. I wasn't supposed to do this, but you leave me no choice. If you take this copy of Windows 95, we will reward you handsomely. In fact, we'll give you your own Caribbean island! How does Montserrat sound?"

"Terrible. There's an active volcano there."

"It's only a small one," the Microsoft man said.

"Look," I said, "even if you DID convince me to take that copy of Windows 95, what would you do then? You'd have totally saturated the market. That would be it. No new worlds to conquer. What would you do then?"

The Microsoft man held up another box and gave it to me.

"'Windows 95....For Pets'?!?!?"

"There's a LOT of domestic animals out there," he said.

I shut the door quickly. There was a surprised yelp, the sound of a laser, and then nothing.

I don't know the pins for an Amiga mouse, but here are the pins for an Atari
mouse:

1 2 3 4 5
6 7 8 9

1 Up/XB
2 Down/XA
3 Left/YA
4 Right/YB
5 not connected
6 Fire/Left button
7 +5VDC
8 Ground
9 Joy1 Fire/Right button

>this up to a meg or meg and a half?? For what I've been quuoted on going to
>a meg and a half by Toad (no offense Toad) - I could buy a 1040 used from
>one of the guys selling one and have money left over!
>Thanks for any help,
>- Gossamer
Well, 1 meg memory is about 50$Cdn, no matter where you get it from, or what
computer you use it for. 2nd hand you could get it for 35-40$Cdn. Marpet in
the UK sells a board for about 100$Cdn so that you can use simms(8 bit I
believe) to upgrade your ST to 1 or 4 meg. So that is about 130$ for 1 meg,
230$ for 4 meg. if ypou wait a bit you might be able to get 4 meg for even
cheaper as people start unloading their macintosh ram.
good luck.bonne chance

4420. Re: Gribnif Patch Programs

: Guys,
: I agree too. I use Neodesk and Geneva and like them both a lot.
: What are the latest versions of both? I tend to move around a lot as part
: of my work and I'm not always abreast of the latest versions of programs I
: have.
: Cheers
: Dean

: ---

Dean,
I just recieved a nice news letter from Gribnif...I'm not sure
how far back their data base goes in determining your making the mailing
list, so, just in case you haven't recieved one of these news letters...
Here is some Info on all of the Gribnif upgrades.

Geneva is now up to release 004...
You can upgrade any release of Geneva to release 004 by ordering a patch
disk from Gribnif. The price is $5.00, and I understand that the patch
is also posted to most of the major online services for downloading.

NeoDesk is now up to version 4 release 003...
If you are still running NeoDesk 3, and would like to upgrade to NeoDesk 4,
then you should send your original disks (both INSTALL and EXTRAS) back to
Gribnif. The cost for this upgrade is $25.00, and it includes a completely
new manual and a fresh disk. To upgrade from any NeoDesk 4 release to
the latest, release 003, then all you need do is order a patch disk from
Gribnif for $5.00, or watch for it on the major online services.

NeoDesk CLI is now up to version 2.1...
A patch disk is $10.00.

XBoot is now at 3.1...
Patch disk costs $15.00 if upgrading from XBoot 2.
$10.00 if upgrading from XBoot 3.

Stalker is now at 3.05...
A patch disk is $5.00 if you already have Stalker 3.??...
Call for details if you have an older version...I've the impression
Older versions require a disk and manual swap, and a bit higher price...
There are also options for sending in both Stalker and Steno as one package.

STeno is now at 2.12
Patch disk is $5.00, will upgrade all 2.?? versions to 2.12.
Once again, call and ask if you have both STalker and STeno that need
upgrading...espically older versions.

CardFile is now at 4.06...
Patch disk costs $5.00 if you are at 4.0 or higher...
Cardfile 2 and 3 to 4.06 upgrades require you to send in your disks
and manual. To upgrade Cardfile 2, the cost is $20.00, Cardfile 3
upgrades are $15.00.

The current address and phone number for Gribnif is...
Gribnif Software
P.O. Box 779
Northampton, MA 01061-0779

Voice: (413)532-2434
Fax: (413)532-2540

All of the upgrades offer real improvemnet...extra features...so I highly
encourage you to order all your patch disks ASAP. Well worth the $5.00!

Brian

4422. New ST owner needs help!

Newsgroup: comp.sys.atari.st
Date: 1995-09-25 00:00:00 UTC
From: ldickey@west.cscwc.pima.edu
Message-ID: <1995Sep25.233636@west.cscwc.pima.edu>
Source record: 158503

Hello Atari St Users-

Could someone help me!

I recently picked up an Atari 520 ST at a local thrift shop. This system
came with the SC1224 monitor, two SF314 drives, and the mouse. Problem is,
no software or manuals came with it and all I can do at the moment is play with
the main screen (built in GUI), and format a disk. It's obvious I'd like to do
more with it.

Could someone answer the following questions:

- What is the standard memory that the 520 came with and how far can I upgrade
it?
- What is the standard DOS that came with it and where can I get a copy
(I'm assuming that there is something more than the GUI that boots up from
ROM)?
- Where can I get a hold of the manual(s) that was packaged with it?
- What sort of programming languages are available for it? (Assuming most of
popular ones such as C, Pascal, os-9, Fortran, etc.....)
- Is there a good VT-100 term program (commercial, share/freeware) and is it
possible to use any type of external modem (assuming a 25 pin RS-232
that it incorporates will work with any modem that has this connector)?

I have many other questions as well, but these are the ones that are burning in
my mind the most. I'd also like to know about some ftp sites available.

Any help would be appreciated.

Thanks-

loren dickey

I need space for new hardware! And $$$'s to upgrade exhisting
hardware! So the unneeded equipment has to go! Not to mention,
I could use the room.... It's getting crowded in here!

F O R S A L E

* 1040STf *

720K Internal Drive
TOS 1.4 ("Rainbow TOS")
2.5mb RAM (Upgradable to 4mb)
Z-Keys
IBM (External) Keyboard included!
Tweety Board!! (For "Stereo" sound)
Original Box
Power cable
Great Condition!!
NOTE: This computer has the nicest, CLEANEST upgrades to it that I
have ever seen. And I've seen a many!
Asking $250 + shipping

* 520 ST *

Power Supply
Original Box
Mega Touch Keyboard
512K RAM
RF Modulator
A 'games' machine mostly
Asking $50 + shipping
Note: I will throw in a copy of the docs to do the 1 meg (cheap)
upgrade for this.

* Futures Systems 3.5" floppy drive model GTS-100 *

External double sided drive
Power Supply
Full black case
Good Condition
LED display
These types of drives work exellently!!
Asking $75 + Shipping

* 2400 baud modem *

Made by Cardinal
New Condition

Original Box
Manual
Power Supply
Asking $30 + shipping

* 14.4 baud Modem *

Made by Intel
New Condition
Original Box
Manual
Power Supply
S/R 14.4 fax
Asking $60 + shipping

* Joysticks *

Some misc joysticks
They will pry go with the 1040 if they have not been sold by then.

OR...

$400 for the package, and you pay shipping

If you have any questions, or your interested in one of the items
listed above, PLEASE Email me (danbrown@on-ramp.ior.com), or call

>

You may be right, what you're talking about would work better than a
TTP. Actually, you need Knife ST to see where the deleted file is and
you have to know what the first letter is. Undelete works easier if the
file is on the root and you know what the name of the file is. I
suggested it because that's what I have and I buy more coverdisk mags
than I do commercial software(You try finding Atari software in the
states without having to send away for it). Still, there's more than one
solution to any problem so your answer is better...as long as Andrew can
get the needed software. I rather undelete something just by clicking on
it myself; this I have clucked! :)

Actually, I've been saying that for about six months. I waited a few months after the merger to see if they would surprise me by really including ST Review into ST Format, instead of simply putting a "with ST Review included" logo on the cover.

They didn't, and I wasn't surprised by it.

The post you quoted was the first time I've said anything on the subject in this forum.

You should try Thorsten Lemke's "GraphicConverter" which converts almost any picture format into any other format. It will definitely convert PICT to IMG. BTW, it is a Mac program and shareware, about $35 I think, for non-European residents. You should be able to find it in any INFO-MAC server.

> The 66MHz figure is double-clocked in the same way as Intel release "double-
>clocked" figures.

Please, not this again!
The '040 is _not_ clock doubled in the sense that the Intel chips are.
If anything, it's clock halved. ;-)

A 486DX2/66 looks the same from the outside as a 486DX/33, but has the
capacity to run twice as fast internally. That is, it can run up to
66 million instructions per second instead of only 33 million.

The '040 on the other hand only uses the 66MHz clock for synchronization
purposes and such. You'll not get more than 33 million instructions/s.
Using the 66MHz figure is only a marketing ploy.

> According to my dealer's price list the difference is US$150. The only
>problem
>with using the full 040 card is that the address fro the FPU also changes which

Address of the FPU?

>may lead to problems with some software. The LC040 should be able to use the
>standard FPU AFAICT.

An '040 does not have the coprocessor interface necessary to use a 68881/2,
unfortunately. All FP stuff will have to be calculated 'by hand' on an LC.

If you save as an uncompressed 24-bit TIFF, GEMview should have no probs; the trouble is that there are so many options in the TIFF spec, nobody ever gets round to supporting them all ... of course you now have a 12MB file, so your next question will be, what archiver can split a file over multiple floppies? :) Um, try tar+gzip ...

> Web. Can anyone out there tell me IN PLAIN, SIMPLE TERMS, what one needs
> to do to gain text-only World Wide Web access on Compuserve with my Atari
> Mega STe using Flash telecommunications software?

I don't think you can. SFAIK Compuserve's web services are only
accessible via the latest versions of [Mac,Win]CIM and Navigator.
Which of course require System 7. :[The interface used between
Compuserve and these clients is *not* published, they only licence
pre-compiled libraries for Mac & PC. So it's not even possible for
some dedicated Atari hacker to come up with a viewer.

I don't even think there's a text-only telnet service available: you
could try GO TELNET, but IIRC it'll try to use that GUI interface
which in your case you have not got.

So my recommendation would be: download KA9Q/NOS (try the version at
ftp.demon.co.uk), and set up a script to use Compuserve's ppp service:
then you'll be able to telnet to an institution which is generous
enough to allow you to run lynx on their machine (yes, they do exist.)
In this case you're just using Compuserve as an internet access pro-
vider. But it works fine, I've done it.

>Any help is appreciated.
>Jeff
well, to point you in a different direction, AtariWorks doesn't use
printer/plotter drivers, but depends on whatever Speedo or NVDI has loaded.
Now with NVDI3 you can write your own drivers, so you could write a driver for
your plotter, not that hard to do really, just follow what your plotter manual
says about control codes. For Speedo, you'd have to ask them, I myself have
never heard of a plotter driver, although you'd think for CAD applications
there would be one at least.
I'd say NVDI3 would be your best bet, don't depend on others to write a
plotter driver, write your own!
good luck.bonne chance

There are shareware Mac programs that convert between various formats (in addition to the Atari ones), including, I think, from Pict, and certainly to Img. One came on a cover disk of a UK Mac mag recently.

4451. Telnet in NOS

Newsgroup: comp.sys.atari.st
Date: 1995-09-25 00:00:00 UTC
From: ewj8218@u.cc.utah.edu
Message-ID: <812059728_OASIS_@u.cc.utah.edu>
Source record: 158590

I finally got Oasis/NOS working with my Internet account, but NOS's telnet seems almost useless to me because it appears to have no terminal emulation options. (like vt100/vt102) Is this correct, or is there a way to get a telnet session in NOS to emulate vt100 or vt102? I'd love to be able to access lynx via telnet, but without vt100 it's just ASCII garbage.

If it were possible to have something like Uniterm's vt102 routines added to NOS's telnet, it would make it 1006suable for me.

>: Why is there a newsgroup for the crappest machine on earth?? (Apart from
>: the VIC20)
>: Get a life- get a PC

How's this - I've got a bunch of games for it that I got for nothing but net connection costs via FTP. I traded an original 2600 joystick for the 520 ST, two double sided 720k drives, and color monitor I've got. AND! It -LOOKS- like a real system on my desk in my office, not like a genesis. So it appears as if I'm really working when I'm actually playing monopoly, tetris, asteroids, Cybernetix, Nitro, or whatever.

Don't get me wrong - I know I could use Opus for Spreadsheets, or 1st Word to word process. I have a PC for all of that though.

I just love my ST for playing games. I recognize that people use if for much more serious work, as do people with Amigas - so don't bash me for saying it's my game machine.

Everything has a purpose to somebody.....

No, there was nothing special. Hmm... perhaps it was the cracked version
that worked straight with Falcon. You see, I had bought Stunt Car Racer
for the ST. Then when I bought STE, it didn't work on that, so I
copied a cracked version that worked fine. It must have been that
the cracked version works on Falcon.

> subscribing to CompuServe, and I can't figure out how to get access to the
> Web. Can anyone out there tell me IN PLAIN, SIMPLE TERMS, what one needs
> to do to gain text-only World Wide Web access on Compuserve with my Atari

(to which Chris Grey replied):

So my recommendation would be: download KA9Q/NOS (try the version at
ftp.demon.co.uk), and set up a script to use Compuserve's ppp service:
then you'll be able to telnet to an institution which is generous
enough to allow you to run lynx on their machine (yes, they do exist.)
In this case you're just using Compuserve as an internet access pro-
vider. But it works fine, I've done it.

Mr. Grey, Thank you very much for trying to explain how I can access the
Web on my Atari on CompuServe. Unlike others, who only spread rumors about
being able to do things they have heard others do, you sound like you have
some real first hand knowledge. Unfortunately, I don't understand a single
thing in the paragraph above. Thanks for trying to explain a solution to
a lamer like myself. --Mark van Wyk

OVERDRIVE

Overdrive has a Worldwide Classified Advertising
Database that is available on the Worldwide Web.
It works just like a newspaper classified advertising
section and is FREE for all to use. You can post an
advertisement of your own, update and delete it.

Sections include:
Announcements and Services
Training and Education
Employment
Financial
Pets and Livestock
Computer & Communications Merchandise
General Merchandise
Real Estate for Rent
Real Estate for Sale
Manufactured Homes
Transportation

When you enter an Ad, you are prompted for a password.
When the record is created, you receive the record
id for your ad. Later, you may update or delete that
ad using the combination of your password and record
id.

Web travelers can search for Ads based on Classified
Section, price, manufacturer, model, etc.

OVERDRIVE can be found at http://www.ipworld.com

Well, I doubt its changed, but in "The Macintosh Bible" (damn, forgot what
edition, I think 6th) it clearly states that is is perfectly legal to copy
the latest system install disks from a friend, your local dealer, or a
users group. Its the manuals, disks and packaging that you have to pay the
upgrade fee for...

4467. Looking for "high tech" font

Newsgroup: comp.sys.atari.st
Date: 1995-09-26 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <449qar$5va@sinsen.oslonett.no>
Source record: 158456

I'm looking for several "high tech" type fonts. I have a few, like
the LCD font,. but need a couple of others...

- The one often used in science fiction movies where the "E" is
mostly 3 horizontal lines and not the vertical line (maybe just
connecting the middle/bottom line together though, and the "A" is
like a triangle.

- The sort of "typewriter" font, but a little more high tech and
"computerized" than the usual one.

- Also a science fiction type... sort of normal, but with a "fat"
part at the bottom and at one side of teh letters..

Is there anywhere I can find these fonts (or similar) as PD/Shareware,
and what are they called?

One design error and that's the reason they didn't market it ?
How come the Falcon made it then ? It has _several_ design errors. ;)

Hi Joerg,

JR>I don't think so!
If you could read the MausNet-Group "Schwaben" you would see, that Atari is dying.
It's hard to belief, but it's true. But belief me, I stay loyal to Atari. But I suffer a bit from this Anti-Atari talking here in Germany.

JR>Look out for the ProTOS '95.
I go together with the ASP (no exhibitor) and the User-Group "Anonyme Atarianer" from Tuebingen. They organize a bus. I hope to find a stay for the two days in Bonn.
Are you interested to meet us where?

JR>It seems to be possible that there will be lots of new products (not
JR>from ATARI of course :-( ).
Yes, but against the arguments of system changers, there can be innovations over innovations. They aren't interested.
It's sad but true!

JR>Also Team-Computer announced that they will present sonething
JR>spectacular. Let's wait and see.
Do you know the exact date of the ProTOS?

Greetings

Years ago, when I still had a 1040ST, there was a lunar lander type of game written by the same people who wrote Dungeon Master. Can anyone give me the name of that simple, but incredibly addictive game?

Isn't there a comp.sys.atari.advocacy for this stuff?

-- George

The blazingly erudite Dave F (Noaddress) wrote in excessive detail:
: Why is there a newsgroup for the cra**est machine on earth??

Because Intel-based clone computers are *still* in use, even though the original design is over 10 years old. And even though the clone users have an inefficient, outdated machine, calling it cra**est is uncalled for!

: Get a life- get a PC

Dictionary Definition for PC: "n. Personal Computer, a microcomputer for use at a table or desk, designed for routine personal or business matters."

Obviously, an Atari computer is a PC.

-- George

BTW -- This really does belong is c.s.a.advocacy

: 66 million instructions per second instead of only 33 million.

Buzzzt. Wrong answer. It cannot run 66 MIPS. The 66 refers to clock
speed, and clock speed alone.

Oh dear, isn't it interesting that such a dosser is reading this newsgroup? Do you tell people who drive round in MGB's or live in victorian mansions to get real and drive a vauxhall corsa or buy a barratt house? After all, what do you use a computer for? Playing games? or should I dare mention... multimedia! MMmm I think that if someone has a purpose for a computer, whether it be midi, graphic design or simply typing a letter, then if they enjoy how a particular system copes with the application, use it! Why use a hammer to crack a nut? Of course I am not saying there's anything technologically wrong with a PC, they represent incredible value for money these days, even if all the parts come from 20,000 different places. Yep, I think newcomers would be better spending their thousands on a pc, if they want to "keep up with the joneses" or join the rat race. This group is for enthusiasts, those who enjoy using a system that perhaps they have grown up with over the years, and has given trouble free service. Atari's might not be upto the speed of a powermac or a pc, nor offer 24 zillion colours and quadrophonic 32-bit sound, but it does many things and is a universal friendly machine. You switch it on and it works! No installing the operating system, or editing config.sys files.
At work i use a 486dx66, after all it provides me with netscape and internet access, as well as fab stuff like coreldraw and word 6. But! its refreshing to get home after a long day and relax using the atari. My harddisk doesnt sound like a hose pipe against a metal bucket for 30 minutes of non-stop activity, and every program is unique and full of character. Ah well, no doubt this will start a flame going, but... isnt that what newsgroups are for? Anyway better finish this before my netscape editor crashes..........

Windoze 95.. plug in and pray?

Glamorous, very pretty, just like playboy,
and full of nothing, but at a price!

The brand new webbrowser STIK works *great* in colour and doesn't require
MINT, X-MINT, CHOCOLATE MINTS or any other mints !
The zipped complete pack called www.zip is 148 K big and includes the
everything you need. Steve Adam is the Atari Hero who put it together
(he's using CAB- cool atari browser for the browsing/also packed in)
and the thing is FREEWARE ! Send 2 pounds sterling and you get free updates
et.c.etc....What a guy...Anyway I just browsed the net with my F030 and it
works great . the SLIPconnetct-program is actually a desktop acc. which you
make the connection with. And then you hit the webs...
Works under TOS and MULTITOS too...

Cheers,
Martin

>Now with NVDI3 you can write your own drivers, so you could write a driver for
>your plotter, not that hard to do really, just follow what your plotter manual
>says about control codes. For Speedo, you'd have to ask them, I myself have

Not quite. The concept behind the NVDI 3 drivers is that NVDI 3 (or rather, the offscreen drivers) generates a big bitmap for you. This is parameterized - the actual driver gives it the width, the height, the number of colours etc, and NVDI generates the right bitmap.

The device-specific bit is what you edit using MAKEPRN. This controls how the bitmap is encoded and sent to the printer. If you don't have a printer that can print big bitmaps (eg plotters, PostScript) then you must write your own printer driver in C or assembler.

Are there any plotter drivers for Speedo 4? These might well be useable in NVDI 3.

Message-ID: <tdlorbpxl9.fsf@tkmhp12.physik.uni-karlsruhe.de>
Source record: 158522

Hello!

Can anybody tell me if there is any tool to convert documents from
Signum 2 to e.g. ASCII or any standard DOS or UNIX format.

This tool has to work under DOS or Unix of course, as if my friend's
ATARI would still work, we wouldn't need this anyway...

(Maybe any 68k/Linux people know some possibility?)

Please answer by email, as I don't follow this group regulary.
With best regards,

=jens=

I use DoubleClick's DCX220C extractor-it seems to do a great job on any
type of compression--ZIP, ZOO, LZH, LHARC, ARC. It's easy to use. I got it
from Suzy Bee's Software, it must be widely available.

: >2. I saw that the TT has all standard ST ports. Can I use my ST DMA
: > devices like a SLM804, hard drives, Super Charger...?
: Yes. Dunno if the SuperCharger needs anything special to work, it may have
: 68000-specific code in its support drivers.
The Supercharger will run perfectly, except for the TT specific video modes,
i.e. TT low/mid/high. But it will run with an SM124-Soft-Emulator for the
TT-high-mode (1260*960 @72Hz ... great!!!)

[...]

: >4. What kind of monitor can I use with the TT? SC1224, SM124, VGA,
: > Multisync SVGA? do you get adapters like the Falcon to match whatever
: > monitor you wish to use? I am aware that a Moniterm monitor is required
: > for TT high resolution.

: Yes, all those monitors will work. I think the TT connector is a standard
: 15-pin VGA type, so you'll need an adapter for using the older ST monitors.
Unfortunately you _CANNOT_ use the good old SM124 due to the fact, that all
video modes (except TT-high) will have VGA frequencies. But you can use
these resolutions with just one monitor!
For TT-high (resolution mentioned above) you will need a monitor with ECL
connection. Remember: The clock rate is about 95 MHz, so you need this
special interface. Some Sun Monitors will do the job...

[...]

Hope it helps.

Martin

P.S.: If you can get one of those TT's .... GET ONE, IT'S GREAT !!!!

Are you sure about this?? It was my understanding that a 486DX33 only clears 14.7 MIPS, but you're implying that it executes one instruction per clock cycle and I've only seen RISC processors do that. I mean, the Falcon's DSP has a parallel architecture and only manages 16 MIPS at 32Mhz.

> it?
The standard 520 comes with 1/2 meg but depends whether it is ST or STE
as to what type of memory it uses. STEs use standard simms (well, the
majority do, some use SIPP)
You can upgrade to 4 meg, try Toad in the US for chips.
> - What is the standard DOS that came with it and where can I get a copy
> (I'm assuming that there is something more than the GUI that boots up from
> ROM)?
TOS is built into the ROM startup and can be accessed only by programs
or programmers. You can get disk based versions but you might as well
stick with the ROM version. GEM is the GUI interface, and again boots
up automatically.
> - Where can I get a hold of the manual(s) that was packaged with it?
You can get 'Your second Manual' from most PD libraries which is a much
improved version of the Atari manual, as it is written by users and not
the programmers.
> - What sort of programming languages are available for it? (Assuming most of
> popular ones such as C, Pascal, os-9, Fortran, etc.....)
C, Assembler, Pascal, Basic and Linix can all be used and there are PD
versions around of most of these.
> - Is there a good VT-100 term program (commercial, share/freeware) and is it
> possible to use any type of external modem (assuming a 25 pin RS-232
> that it incorporates will work with any modem that has this connector)?
The best Terminal program in the PD scene is Vanterm, it supports most
modems upto 19.2k. There are better commercial ones but I can't
remember their names now! <g>
> I have many other questions as well, but these are the ones that are burning in

Best thing is to look around Umich which is the biggest Atari archive.
It is situated at Umich.edu

Make sure you've set the cache directory up properly, its in the
'Paths' menu I think. I f you don't set this to a directory that
exists it comes up with 'Error Reading Page' the moment you try and
connect to any URL...

Hope this helps you out, cheers, Gazza

The archiver you need is lharc.ttp or lha.ttp. There is also an LZHSHELL.APP
about at the umich site which gives you a pretty front end a'la STZIP.

Try src.doc.ic.ac.uk in the packages/atari/umich directory.

Hope this helps.

I believe that the last upgrade for Pagestream was the final version; and
that "SE" is that version. It's my understanding that there is no _new_
update being offered. From what I've seen of all the threads on
CompuServe related to the subject, it's been pretty clear that no further
work has been done on an Atari version. However, I do plan to ask
Soft-Logik to "define" the 'SE' version, to be sure.

Hello Tommi,

> I have heard that Cubase Audio for Falcon ONLY uses SCSI-drives for
> hard disk recording. Then again, a friend of mine swears that CAF also
> supports up to 4 tracks using IDE...
>
> My quick testing around this subject failed - but what is the
> truth..?

You can consult your user's manual to learn this, but anyway:
Cubase Audio can't use anything else than SCSI for direct recording and
playback. The only thing IDE can be used for is to store RAM- and
Sampler-tracks (after they have been recorded on a SCSI-drive). To use these
functions you need more than 4MB of RAM (i.e. 16MB). If it's used this way, the
audio is loaded directly into the memory when loading the song. The only way
for real-time working with Cubase Audio is with SCSI-disks.

There is AudioTracker from SoundPool, which is an 8-track audio recorder
(without sequencer), where you can use either IDE or SCSI. With an IDE drive
you can use 4-6 tracks depending on how fast the drive is.

Best regards,

Claes

>
>Are you sure about this?? It was my understanding that a 486DX33 only clears
>14.7 MIPS, but you're implying that it executes one instruction per clock

When the 486 and '040 processors were new I read several articles were
they mentioned that the average number of clock cycles per instruction
(presumably calculated dynamically) for the 486 was about 1.8 and for the
'040 1.3 IIRC.
To reach those numbers you certainly need to have some instructions that
can execute in one clock cycle.

It would really be disappointing if advanced pipelined processors like
the above couldn't get a one instruction per cycle through-put with for
example 32 bit adds between registers. They certainly will take a while
doing division, though.

The MIPS figure you mention is not too far from 33/1.8 and it may of course
be actual VAX MIPS or some arbitrary instruction mix. I can assure you that
not every instruction on a 486 takes 2.24 cycles to execute. ;-)

>cycle and I've only seen RISC processors do that. I mean, the Falcon's DSP

RISC processors are certainly not the only ones with single cycle
instructions. Take a look at the Pentium or '060 if you want to see some
really impressive CISC architecture implementations.

>has a parallel architecture and only manages 16 MIPS at 32Mhz.

For a DSP, MIPS is a lot less informative than for general purpose CPUs
(and it's almost useless even for the latter). A somewhat more useful
figure would be MOPS, which the 56k will get 6*16M IIRC. That would be
one multiplication, one addition, two data moves and two address register
updates. it might be able to do a jump in there as well (hardware loop).

What do you mean with 'has a parallel architecture', by the way? It has
less pipeline stages than an '040 and both have separate internal busses
for instructions and data. If anything, the '040 is more parallel, but I
wouldn't call either of them that.

All the major sequencers on the Atari platform have a device which generates and reads SMPTE, unfortunately most of the devices only work with the sequencer they were designed for i.e. one cannot use a Phantom with Logic, for instance.

So, with this in mind, what sequencer are you using? If you're using Logic, Emagic makes the Unitor II which will, among other things, generate and read SMPTE. Steinberg made the Time-Lock for use with Pro-24, they make a newer version for use with Cubase. Dr.T's made the Phantom for use with KCS/Omega ...

If you're just looking for the hardware and want to write the software yourself (yeah, right), or are looking for a sequencer/SMPTE pair, I have Pro-24 (I don't use it, I use Logic) and the Time-Lock SMPTE device for it, if you're interested.

Mattias G. Hembruch (mghembru@dictator.uwaterloo.ca) wrote:
: Some of the older readers may recognize me from my involvement with this
: newsgroup WAY BACK around '90/91. It won't kill me if you don't. Anyway,
: I've been out of the Atari world for quite some time, even though I still
: have my 1040STFM w/ ICD host adapter & hard drive up and running. I mainly
: use it for things like print master (so I'm too cheap to buy a PC version - sue
: me). Today I bought a used Mega 2ST w/ TOS 1.4 for $40 (minus power supply and
: internal floppy). However, I have a spare power supply (or just get a line from
: my hard drive setup), and I have a hard drive, so I don't really need a floppy.
Don`t power your Mega with your HD-powersupply! This will most certainly
result in a broken PSU...

:
: I've scanned the newsgroups to see what's up, and I've seen a bunch of programs
: mentioned that I really have no clue about. eg: Geneva, MagiC, AES4.1. Can
: someone give me a BRIEF rundown of what these progs are all about? I'm
: hoping to upgrade the Mega2 to 4 megs soon. So, I'd love to get a unix-like
: setup. I know the machine is no speed demon, but I'm sure it could be
: useful for simulations & such. I played around w/ MiNT way back when, but
: it was just running out of memory way too soon.
:
MagiC is a german multitasking, TOS-kompatible OS for all Ataris (Except
Falcons.). AES 4.1 is the latest version of MultiGEM, but it is not officially
released. Just like the old MultiTOS, it uses MiNT for the actual multitasking.

Geneva is a hybrid of the two mentioned above. Basically it`s just a new AES,
just like AES 4.1, but it supports multitasking on its own. So you can run
Geneva on any ST or Falcon and get multitasking and full AES 4 support on all
machines. Very powerful, but slower that MagiC. The latest version of Geneva
supports MiNT with all it`s extensions, like MiniX filesystem and MiNTnet.
This way you can get the best of two worlds: A stable and powerful, *multi-
tasking* GEM-environment, and all the unix-tools you want.

: First, I should say, I'm looking for free s/w only - I have a PC as my main
: machine running Linux, OS/2, DOS, Win3.1 (in that order). I wouldn't mind a
: task-switcher/multitasker and some unix utilities, as well as a gcc setup.
:
Look above.

: What would be a good setup to go with? Can I run MintNet on my system to set
: up a SLIP/PPP session to my Linux box via NULL modem?

I really don`t know, but I *think* that this is possible.

: Are there any cheap accelerators out for the Mega2? It has a VME bus slot,
: does it not?
:
Look for the T28 and T36-accelerators from System Solutions, UK. They`re quite
cheap and very fast. And no, a Mega *ST* does not have a VME bus. It does have
a processor-bus, but it`s not VME. The only Ataris that have VME is Mega *STE*
and TT.

: Thanks,
: Mattias

4525. ST parts for sale!

Date: 1995-09-27 00:00:00 UTC
From: BRYEDEWAARD@news.delphi.com
Message-ID: <44clsk$s4i@news2.delphi.com>
Source record: 158409

I am getting rid of a bunch of old stuff from my closet, and thought someone might be interested in the following:

1040ST case & motherboard

This is a DEAD 1040 with a good keyboard and case. There are still some useful IC's in the board.

520STM case & motherboard

This is an incomplete 520, but it has a fully socketed board, so hopefully it can be revived by fully populating it. The keyboard is incomplete.

520STM motherboard

This is a 2nd fully socketed incomplete board. Unknown condition.

3 1040ST power supplies

Again, I don't know if these work, but I'm pretty sure at least one is quite dead.

All these parts can be yours for $25 + shipping.

-Bry

4526. LZH compression?

From: CALLUM.LERWICK@flight.org
Message-ID: <00d_9509280107@flight.org>
Source record: 158411

A giant chicken in the guise of ldickey@west.cscwc.pima.e clucked:

> - What is the standard memory that the 520 came with and how far can I
upgrade
> it?

512k is standard. You can do a DIY upgrade to 1mb. (this is not for the
faint hearted) Or you can get a commercial upgrade up to a maximum of 4mb.
(I think you can still get 'em for the old 520ST, please tell us if it has
a built in drive or not.)

> - What is the standard DOS that came with it and where can I get a copy
> (I'm assuming that there is something more than the GUI that boots up from
> ROM)?

Nope, there aint. (generally speaking)

> - Where can I get a hold of the manual(s) that was packaged with it?

Don't bother. The cable pinouts are the only usefull thing in 'em...

> - What sort of programming languages are available for it? (Assuming most of
> popular ones such as C, Pascal, os-9, Fortran, etc.....)

C is popular. GFA Basic is also very popular. (this aint your daddy's
basic!)

> - Is there a good VT-100 term program (commercial, share/freeware) and is it
> possible to use any type of external modem (assuming a 25 pin RS-232
> that it incorporates will work with any modem that has this connector)?

Yep, its a standard RS-232 port. And the printer port is a standard
Centronics parallel.

> I have many other questions as well, but these are the ones that are burning
in
> my mind the most. I'd also like to know about some ftp sites available.

atari.archive.umich.edu is one of the major ones, micros.hensa.ac.uk is a
popular, very* well kept site. For best results connect there with WWW or
Gopher. There is an FTP site list somewhere, you can probably find it by
connecting to hensa via WWW and following links 'till you find it...

jprice@ivory.trentu.ca wrote:
: Sounds great. Where can I get it and what do I need to run it?

I found it on ftp.uni-kl.de in the incoming directory. I think you can run
this on everything from a 1 meg ST with colour-monitor or TV and upwards.
It works quite well on my Falcon, even in 16 colours.

SCC-DMA and SCSI-DMA can access both ST- and TT-RAM.
Sound-DMA and ACSI/floppy-DMA are limited to ST-RAM.

From: luccau@glo.be
Message-ID: <812237368_OASIS_@glo.be>
Source record: 158420

Hi to you all.

As I'm fairly new to this Internet thing, I took a lot of interested in reading about these offline Web Browsers for our machine. (using a 1040 ste /4 meg). I've got HTML Browser and it looks real nice. I'm also using Oasis to go online, but now the point is : How do I download these Web pages? I've tried to FTP to such a page but that is obviously not the right way to go.
So could anyone please explain me how to do this step by step.
Many thanks,

L > do more with it. Could someone answer the following
L > questions: - What is the standard memory that the 520 came
L > with and how far can I upgrade it?
520K. Doesn't sound like much, but most ST software will run on it.
Until you know what all you'll be doing with it, there is no point
in upgrading. Yours may have already been upgraded, but probably
not. Cheap but maybe not easy upgrade to 1M (text files around),
more expensive to 4M (several possibilities - but I recommend that
you stay away from ZRAM), even more $$$ to 8M (12M?) (Marpet board,
available from Toad Computers)

L > What is the standard DOS
L > that came with it and where can I get a copy (I'm assuming
L > that there is something more than the GUI that boots up from
L > ROM)?
Nope - the whole OS is in ROM. There are plenty of enhancements
around, desk accessories and auto folder programs, and other OSes,
but everything you need for the moment is already there.

L > Where can I get a hold of the manual(s) that was
L > packaged with it?
I bought one from Atari Corp - call them up and ask.

L > What sort of programming languages are
L > available for it? (Assuming most of popular ones such as C,
L > Pascal, os-9, Fortran, etc.....)
I have seen most all of those and more.

L > Is there a good VT-100 term
L > program (commercial, share/freeware)
Opinions vary - STalker (commercial - about $35) does vt100, but I
am not using it at the moment. FreezeDriedTerminal does vt100 too,
but its status is not clear.
L > and is it possible to use
L > any type of external modem (assuming a 25 pin RS-232 that it
L > incorporates will work with any modem that has this connector)?
Pretty much, although there may be some weirdies out there that do
not work, or work well. Any Hayes-compatible modem should work.

Message-ID: <950927130007194 31@acpu.com>
Source record: 158422

Greetings, Professor Olin!

MO> (Press release(?) about Pagestream 2.2 snipped)

MO> What's the real story here?

Pretty obvious to me. SoftLogik is trying to wring any remaining
value out of their R&D costs for PageSTream 2.2. I can't really say
that it is a bad move. We attempted a letter writing campaign to
keep them working on the v3 port to Atari, and to continue after
that, but we obviously failed.
At $39, v2.2 represents darn good value. I have used 2.2 for
several years, and it works well. Pretty slow on my ST, but
acceptably fast on my TT.
For those retailers that have stocks priced at ~$200, the
announcement may come as a shock, but I hope that SoftLogik
coordinated with them so that "dusty copies" will not now have to be
sold at a loss.
Which reminds me: anybody want to buy Publishing Partner, PageSTream
1.51, and/or 1.8? _real cheap_! (:-)

"The Poor Deluded Soul"
tderrick@acpu.com

... Despite of the cost of living, it remains popular.

4539. Laser C patch for TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1995-09-27 00:00:00 UTC
From: tderrick@acpu.com
Message-ID: <9509280000819472@acpu.com>
Source record: 158423

Greetings, Professor Matthias!

MG> Like it says - I've just aquired a machine with TOS 1.4, and
MG> now I find that my Laser C doesn't want to run. It says "not
MG> compatable with this TOS - use patch.prg".

Probably what you need is tos14fx.prg, and poolfix4.prg. Do not use
poolfix92, according to John Eidsvoog, who would know. Atari made
several mistakes in tos1.4 (rainbow tos), and these two are
required to put it right. They are run in the auto folder.
You'll also need a "serial patch" for telecommunications - I used
serfx20.prg, but consensus around here is for HSModem6 (I think I
didn't get the name right).

4541. Re: New ST owner needs help!

Newsgroup: comp.sys.atari.st
Date: 1995-09-27 00:00:00 UTC
From: Eric Noss <enoss@planetx.bloomu.edu>
Message-ID: <Pine.SUN.3.91.950927170952.3065A-100000@planetx.bloomu.edu>
Source record: 158425

ldickey@west.cscwc.pima.edu has pleaded:

>Could someone help me!

Yes, I can....have a seat grasshopper, while I explain the mysteries
of the ST.

- What is the standard memory that the 520 came with and how far can I
upgrade
it?

520's have 512K of RAM. It's enough for the smaller programs, but
for the more complicated stuff you may need to upgrade. With certain
upgrades, you may be able to get up to 14Mb(but some real true ST
guru can confirm this).

- What is the standard DOS that came with it and where can I get a copy
(I'm assuming that there is something more than the GUI that boots up from
ROM)?

You already have it! See, the whole TOS system contains a 16-bit
clone of MS-DOS and the GEM interface(the GUI) on one single 192K ROM
chip. To upgrade that, you can either get a newer TOS chip or use
patch programs which you can just stick in the AUTO folder.

- Where can I get a hold of the manual(s) that was packaged with it?

You can try Atari, but I doubt if they can help much. Basically, you
don't have to read much in the manual to use the ST. Feel free to
play around with it.

- What sort of programming languages are available for it? (Assuming
most of
popular ones such as C, Pascal, os-9, Fortran, etc.....)

The most popular ones are C and assembly. The two top BASIC's are
GFA and STOS(with some extensions). You can also get Pascal,
Fortran, Cobol...but you may have to look around a bit.

- Is there a good VT-100 term program (commercial, share/freeware) and is it
possible to use any type of external modem (assuming a 25 pin RS-232
that it incorporates will work with any modem that has this connector)?

The two good commerical programs are STalker 3 and Flash II. Any
ANSI terminal like KM-Term canwork on the Internet except for IRC
which needs a pure VT-100 like ST-Term which is old. Any external
modem with a 25-pin RS-232 will work on an ST. Make sure you get the
right cables for it.

>I have many other questions as well, but these are the ones that are
burning in
>my mind the most. I'd also like to know about some ftp sites available.
>Any help would be appreciated.

You can start out with ftp.toad.net as a site. Go to /pub and /umich
for the good stuff. These web pages can give you easier access:

HENSA/micros (UK) Atari Software Archive
http://micros.hensa.ac.uk/micros/atari.html

UMICH Software Archives (Gopher)
gopher://gopher.archive.merit.edu/11/.software-archives

For the commerical stuff, I recommend Toad Computers. Call
(410)-544-6943 and ask for their catalog. If you can find a Atari
user group, then that will be real helpful. Although you can read
the postings on comp.sci.atari.st and there's also the IRC channel
#atari which I'm on as well as other Atari people. The ST community
is on that helps out other Atari computer users. Keep asking around
for anything you need, someone might point you to a FAQ.

>Thanks-

No, prob :) Welcome to the world of Atari Computers.

Eric Noss

for awhile. I will accept almost any of your unwanted working (or
near working) computers (even the old eight bit ones). I will pay
for shipping. Please E-mail me all replies. Thanks. -Jason-

4543. Getting back in touch with the ST world

Newsgroup: comp.sys.atari.st
Date: 1995-09-27 00:00:00 UTC
From: mghembru@dictator.uwaterloo.ca
Message-ID: <DFJEv4.B84@novice.uwaterloo.ca>
Source record: 158466
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Some of the older readers may recognize me from my involvement with this newsgroup WAY BACK around '90/91. It won't kill me if you don't. Anyway, I've been out of the Atari world for quite some time, even though I still have my 1040STFM w/ ICD host adapter & hard drive up and running. I mainly use it for things like print master (so I'm too cheap to buy a PC version - sue me). Today I bought a used Mega 2ST w/ TOS 1.4 for $40 (minus power supply and internal floppy). However, I have a spare power supply (or just get a line from my hard drive setup), and I have a hard drive, so I don't really need a floppy.

I've scanned the newsgroups to see what's up, and I've seen a bunch of programs mentioned that I really have no clue about. eg: Geneva, MagiC, AES4.1. Can someone give me a BRIEF rundown of what these progs are all about? I'm hoping to upgrade the Mega2 to 4 megs soon. So, I'd love to get a unix-like setup. I know the machine is no speed demon, but I'm sure it could be useful for simulations & such. I played around w/ MiNT way back when, but it was just running out of memory way too soon.

First, I should say, I'm looking for free s/w only - I have a PC as my main machine running Linux, OS/2, DOS, Win3.1 (in that order). I wouldn't mind a task-switcher/multitasker and some unix utilities, as well as a gcc setup.

What would be a good setup to go with? Can I run MintNet on my system to set up a SLIP/PPP session to my Linux box via NULL modem?

Are there any cheap accelerators out for the Mega2? It has a VME bus slot, does it not?

Thanks,
Mattias

4544. Laser C patch for TOS 1.4?

Newsgroup: comp.sys.atari.st
Date: 1995-09-27 00:00:00 UTC
From: mghembru@dictator.uwaterloo.ca
Message-ID: <DFJo65.K08@novice.uwaterloo.ca>
Source record: 158467
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Like it says - I've just aquired a machine with TOS 1.4, and now I find that my Laser C doesn't want to run. It says "not compatable with this TOS - use patch.prg". Shortly thereafter I get 4 (or was it 5) bombs. Any ideas?
Is there some program to reset my TOS version to fool the program? Is this patch actually available?

Thanks,
Mattias

512Kbytes, upgradeable to 1M, 2.5M or 4M.

> - What is the standard DOS that came with it and where can I get a copy
> (I'm assuming that there is something more than the GUI that boots up from
> ROM)?
Nope; what you see is what you get; great, eh? No system disks, etc. The
OS is not subtracted from your meager .5M of RAM

> - Where can I get a hold of the manual(s) that was packaged with it?
Check for a local Atari User's Group; there are many out there, and/or
check with some of the people who post here advertising hardware or
software for sale. My first Atari came without manuals, and I didn't miss
them very much. It's really that easy a system to use! If you're used to
DOS, this is gonna seem like falling off a log!

> - What sort of programming languages are available for it? (Assuming most of
> popular ones such as C, Pascal, os-9, Fortran, etc.....)
Somebody else better take this one; I know Basic, C, Pascal are in there...

> - Is there a good VT-100 term program (commercial, share/freeware) and is it
> possible to use any type of external modem (assuming a 25 pin RS-232
> that it incorporates will work with any modem that has this connector)?
STalker 3 has VT100 emulation; if you get it, also get STeno, the online
text editor .ACC. Flash II no doubt covers VT100 (both commercial) Uniterm
is a shareware program which does, and others such as Connect, etc.
Yes the RS-232 is standard; most external modems such as Supra, Practical
Peripherals, Hayes, US Robotics, will work with Atari, Amiga, or DOS box.

: Jeez what a coward.

That's what they usually are... Spoiled children who think they're smart when they try to irritate other people. I wouldn't say he's a coward, though - necessarily... I think that guy just wants to make people angry at him, and he doesn't bother to start any intelligent conversation. He doesn't care about your or my opinions, or facts. He just wants to insult - that's all, I think... Sad, isn't it? Internet seems to be a good place to get relief to your frustrations (e.g. because of owing an Amiga ;-) by
writing senseless messages here and there!

Maybe this message is useless and senseless, too - but at least, I don't want to insult Amiga-owners in their news-areas. I think they're mostly people like us - and against the Bill Gates -imperium, like us. So, we're on the same side, after all...

>
>Buzzzt. Wrong answer. It cannot run 66 MIPS. The 66 refers to clock
>speed, and clock speed alone.

That depends on your definition of MIPS. I said _up to_ 66 million instr/s.
I've never claimed a MIPS figure.

It should be easy to see, though, that having an average instruction time
of 1.8 cycles, or even the 2.24 someone else mentioned, more or less
requires that some instructions do in fact take a single cycle to execute
(or rather don't stall the pipeline).
Sure, you won't be able to do anything much with only such instructions,
but that's beside the point. They exist, and therefore you _can_ execute
them at a rate of 66 million/s. You might not be able to do it for a whole
second either (depends on if there are any single cycle jumps), but that's
also beside the point.

The number 66 of course refers to the clock speed, but I'm sure you'll
agree there's a relationship between that and the execution time of the
instructions. The fact remains that the DX2/66 _can_ run twice as fast as
a DX/33 and there has got to be instructions that don't stall the pipeline.
Intel could very well do a DX2/66 that could be put directly into a DX33
socket, without even changing the external clock, if they wanted. Doubling
the frequency could be done internally (perhaps they already do this).

Just a hint for You who design WWW-, FTP- and other Internet-stuff... Please, try to develop a sensible installer program! I'm probably not the only one who had to surrender after trying to get DuFTP (with MiNTnet), X11 for MiNT's WWW- connections, or even OASIS 1.20 (with NOS) to function... =-(

Especially the very UN*X-like MiNT requires very much knowledge - and there isn't much comprehensible information easily available. And, sadly, packages like DuFTP and OASIS don't help much with setting up the connection! They apparently presume that one knows how to use MinixFS, SLIP, etc. This has to change, if these programs are meant for common use among all kinds of people.

Or are Internet-services on Atari platform meant for "pros" only.. ;-) ?

Greetings,
TH

If you look at the reply from `Steven J. Pagliarulo', you might notice that it can from Pipex/Unipalm, which (coincidently?) is the same site that the other clueless postings have originated. It was also posted using that wonderful invention Netscape, which allows you to put any return address and name that you like (or none at all).

Just a guess, but if the program wasn't developed after its initial release, the author has long left the Atari scene and is unlikely to be reading this group.

Don't start this thread again, PLEASE!

The Motorola chips are _not_ clock doubled in the same way as the Intel
chips. Claiming a 66MHz 040 is misleading.

Well, it does say it is rereleasing 2.2 so I doubt very much if
the program will be any different to the previously released one.
It's still a pretty good deal for $40 though. (that's what I call a price
reduction!!)

I do own 2.2b and would love to see an improved version (it needs it!) but
I don't think this is it. :(

Fl> copy (I'm assuming that there is something more than the GUI that
Fl> boots up from ROM)?

Npe. What's in ROM is what you get. Lok at the version number in the "About" box. If it is less than 1.4 you would do well to get an upgrade ROM (around $40) some time, especially if you get a hard disc.

Fl> - Where can I get a hold of the manual(s) that was packaged with
Fl> it?

Don't bother - they are not very useful.

Fl - What sort of programming languages are available for it?
Fl> (Assuming most of
Fl> popular ones such as C, Pascal, os-9, Fortran, etc.....)

Can't think of a language which ISN'T available (except RPG, perhaps). Quite a few are PD so all you need is the inclination!

Fl> - Is there a good VT-100 term program (commercial, share/freeware)

There are quite a few, I use Connect. You can try it out for 30 hours free but then need to pay registration (about $40) for a manual and key.

and is it possible to use any type of external modem (assuming a 25 pin RS-232 that it incorporates will work with any modem that has this connector)?

Yes but try to find a Hayes-compatible. Make things a bit easier when comparing notes with other modem users.

Actually, that how it works. You can plug a DX2 into a normal DX-33 motherboard.

The double-clocking is totally internal.

4573. Help with STiK!

Newsgroup: comp.sys.atari.st
Date: 1995-09-27 00:00:00 UTC
From: gordo@dsoe.com
Message-ID: <44c73s$8k6@sulla.cyberstore.ca>
Source record: 158496

I set up STiK as the instructions say but it will not dial.

I have an Falcon030, with GVC 28800 V.34 modem hooked up to the modem port, and a 212 external scsi II c:\ drive. I have no other accessories running except STiK, and when I choose connect, the mouse pointer changes to a busy bee and then does nothing, no dialing, I have to then reboot.
I set up the STIK_CFG directory as indicated in the instructions with the default.cfg file containing Modem 2 as the SERIALPORT variable. I got the Modem 2 variable from the listport.tos program which is supplied with the package. I configured the default.cfg and the dial.scr files as indicated in the readme file and by what it says in those files, but still does not do anything when I try to connect. I worked on this for 3 hours yesterday, HELP! I already know about the cache path problem for CAB, but that does not do me much good if I cannot hook up to me internet provider, which I can hook up no problem with my communincations program!

Basically all kinds of programs are copyrighted, no matter if the company still sells for 8 bit or not. As far as I know, it even does not matter if the company is still in business, because copyright can be owned by the people that wrote the program, too. And even if they died, it still is protected for 50 years!

Hi Maarten,
I believe that K-graph 3 is still available from HiSoft. The price is GBP49.95
according to their catalogue. Haven't tried it myself, but HiSoft usually have
good products.
I don't know of other programs like it, but as you say there should be others
too - maybe Shareware?

MG> development team, but progress is continuing to be made and
MG> Wizztronics still plans to release this product as soon as the last
MG> of the remaining hurdles have been successfully overcome".
MG>
MG> With a statement like that, how can "you" be so sure?

Because I called Steve in New York less than a week ago and he assured me
that the problems had been solved. I don't have any particular reason to
disbelieve him. As far as the Hawk is concerned, he told me that they had had
one up and running without problems for over 3 weeks. The man wants me to order
quantity and I told him I'd order when the product was ready.

>> MG> Suppose to be an 030/48mhz "Hawk" available soon for 750.00

The new price from Wizztronics is US$699 including the 80Mb uppgrade
card.

>> The Hawk documentation states "100% compatibility".
MG>
MG> Have you had you timing mod today? :)

They were aware of the problem and say it's been solved.

MG> Or the current issue of AEO. :)

Haven't read AEO for the last 6 months or so, so none of what I said came
from there.

: **

Well It works in normal low res' 320x200 and seems to self adjust the
font (wild or what?), it works perfectl;y in medium rs' 640x200,

THE MAIN REASON FOR THE BOMBS is the cache settings, if you are running
on a floppy system then make yourself a folder named cache on drive A and
set your paths accordingly, this was the tip from steve adam the author
after speaking to him on IRC using his very own STik, it can still bomb?,
but this will sort most of it out,
The program as far as i can tell doesent seem to clear the cache folder,
after a bomb out i look inside and its full of folders and files from
previous links,

I am manualy using an accesory to delete the files every now and again,
I dont suggest you do this at all, i am just pasing on what i am doing,
EVERYONE is getting a crash now and then, but the above helps,

I also get the odd two bomb crash on IRC after pressing return to
select the default channel, keep trying as it does work eventualy,

I have tried all the above on a ste, fm and mega,

I also now have (thanks to the STik author) a document explaing all
the commands and everything you need to know about IRC as i am sure many
of you are discovering this for the first time (like i was), well e-mail
me and i will send it you, there is a lot more to irc than meets the eye,
its a whole new world,
hope something in here helps,

Cheers........!ynoT

4581. Re: Web Access With CompuServe? (long, sorry)

Newsgroup: comp.sys.atari.st
Date: 1995-09-28 00:00:00 UTC
From: cgra@se.bel.alcatel.be
Message-ID: <44en7e$594@btmpjg.god.bel.alcatel.be>
Source record: 158304

Me:
So my recommendation would be: download KA9Q/NOS (try the version at ftp.demon.co.uk), and set up a script to use Compuserve's ppp service: then you'll be able to telnet to an institution which is generous enough to allow you to run lynx on their machine (yes, they do exist.) In this case you're just using Compuserve as an internet access provider. But it works fine, I've done it.

Mark van Wyk:

Mr. Grey, Thank you very much for trying to explain how I can access the Web on my Atari on CompuServe. Unlike others, who only spread rumors about being able to do things they have heard others do, you sound like you have some real first hand knowledge. Unfortunately, I don't understand a single thing in the paragraph above. Thanks for trying to explain a solution to a lamer like myself. --Mark van Wyk
markvanwyk@aol.com

Well, thanks for the compliment ... I'll try to say it more slowly.

There's a program which is sometimes called KA9Q (after the call-sign of the ham radio freaks who originally developed it), and sometimes called NOS (Network Operating System, I think). You can download this either from an ftp site (but that would assume you already had some kind of internet connection), or from Compuserve (GO ATARIPRO and have a look at the libraries).

KA9Q comes in three parts: you'd want the Binaries (i.e. the program) and the Documentation. (The third part is the Source code, which you don't need). When you unpacked these, you'd find (in the Documentation) some instructions on writing a dialling script. This just tells the program what it has to do to get connected: send the dial comand (ATDnnn-nnnn) to the modem, send a couple of carriage returns, get a prompt, type CIS, be prompted for User ID:, etc., all the stuff you have to go through when you log onto compuserve. I guess you use something of the kind already, unless either (1) you use Jim Ness's QuickCIS, or (2) you do everything by hand.

Your script for KA9Q would contain the magic words GO PPPCONNECT. This causes Compuserve to stop acting like Compuserve and become a gateway to the internet. From that moment your ST becomes part of the internet, and can connect to any other computer on the 'net. That includes "ftp sites" where you can find lots of shareware and dirty<<<<<beautiful pictures, "news servers" from which you can download Usenet news, and places that will let you "telnet" in, meaning that your ST becomes a terminal on their machine.

This last category includes servers for gopher (a predecessor of www)
and archie (who searches archives for files), and last but not least
it includes places that will let you use their text-mode web browser.

Well if you didn't get it this time don't worry; if you want to telnet
to a place then just log on to compuserve and type GO TELNET. And
this new program STiK should work via Compuserve's PPPCONNECT; I'll
try it just as soon as I get around to it.

This must be very boring for most people, send me CIS mail at the
address below if you need more advice. Or see you in ATARIPRO ...

Thank you VERY much for the simplified explanation. I managed to download STI
K off of the Web with my Mac at work (during lunch, of course). I then took an
IBM formatted diskette, and transferred the file from the Mac to the diskette.
I now plan to attempt to load the software onto my Arari Mega STe at home from
the diskette. My next challenge will be to attempt to unZIP the software. Aft
er that, the next big challenge will be to purchase a decent modem, some decent
telecommunications software (I currently have a 1200 baud modem and the origina
l Flash by Antic -- WON'T DO FOR WEB BROWSING), and attempt to get up and runni
ng surfing the Web with my Atari computer. BTW, your simplfied explanation may
be of interest to more people than you think. I'll bet that "most people" are
just as confused with jargon as I am. --Mark van Wyk

Actually, Motorola did go so far as to produce a "clock doubled" 68040V
about the same time as Intel was readying the DX2 for sale. It reached
first-silicon, but I do not have any info on whether it was released for
sale.

> unfortunately. All FP stuff will have to be calculated 'by hand' on an LC.

The LC and EC variants of the '040 lack an MMU and FPU.

A 'memory mapped' FPU may be possible, however. (can anyone say Atari
SFP001? [Optional FPU for Mega ST and Mega STE, that is accessed as a
memory mapped device, allowing 68000 systems to access it, whereas 68000
systems can not talk to it "direct" like an '020 and '030 can)

Yes... This sounds familiar. Delete the file HTML.INF from your CAB directory (or rename it). It is full of directory paths which probably do not exist on many systems.

HTML should then boot OK, going into 'options' will enable you to set your own paths for HTML and CACHE directories and you should be OK.

Hope this helps...

Steve Found.

Why not try deskpicture. Actualy it was one of the first programs released
for the Falcon, as far as i remember.

K-Graph 3 is ok, but the method of data entry is very idiosyncratic and
you may easily hate it. It can accept data from spreadsheets like K-Spread
as well, but again the method of doing so isn't very nice.

The output format are Degas, IMG and Metafiles.

A definite try before you buy - I bought v3.9 (aka v3.09) in 1989 and when
I updated it recently it had only reached v3.11 (also in 1989).

I just got a Archive Viper 150 for my Falcon, and when I tried to run Diamondback 3 for a test backup, I got a 'sense' error when Diamondback tried to access the tape drive to begin backup. It even does this if I turn off the 'Immediate Commands' option for SCSI tapes. Has anyone experienced this problem with their setup? What could I be doing wrong?

Thanks!

David (lamarth@delphi.com)

>>
>Incredible! Now you must decide to use CaTTamaran or MightyMic card !!
>Do you know PowerUP TT from CATCH COMPUTER? Have information about it ?
>I only know the price but not technical characteristics...

What do you mean, incredible ?
I have both the CaTTamaran AND the PowerUP TT cards here before me. They're
completely identical as I said before (or didn't you read that ?)
And guess what ? On the manual it says : " CaTTamaran
PowerUP TT "
Now how's that for proof ?
About the MightMic card... If *you* would have 32 MB's worth of 30-pin SIMMs
in one of those, you wouldn't be prepared to buy a better card that needs
72-pin SIMMs either, now would you ? :-(

4600. Re: Any Cheap Memory Upgrades for 520 STs out there??

Newsgroup: comp.sys.atari.st
Date: 1995-09-28 00:00:00 UTC
From: "K.R. Hodge" <hodgek@ehche.ac.uk>
Message-ID: <44e302$j7u@rs3.rz.uni-hohenheim.de>
Source record: 158323

It should be much cheaper - with an unpopulated Marpet board you should be able to slot in 4 256k simms. At current U.K. prices I estimate that the operation would cost a little under 40 dollars. If you're lucky there might be an STE owner out there with the simms knocking around - I originally upgraded my machine for nothing that way...

Which version of Flash? Are you using the old Antic version or the newer
Flash II?

Although the older Antic version of Flash has a VT100 emulation (you need
to select ANSI mode) it wasn't the best VT100 emulation around. The newer
Flash II has a true VT100 emulation that might work better for you.

4610. Which simms for FalconWing??

Newsgroup: comp.sys.atari.st
Date: 1995-09-28 00:00:00 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <44el1j$b8d@lyra.csx.cam.ac.uk>
Source record: 158429
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

What kind of simms does the Falcon Wing board take?
Are there any other alternative *cheap* memory boards for the Falcon?

I have the chance to buy 4x4mb 30pin 9 chip, 9bit 70ns simms. Are these
likely to work?
Also, what is the difference between ST ram and Fast ram? Are the simms
themselves different or is it just how the rest of the machine accesses them.
I would like to be able to use these simms in a future fast ram upgrade.

Thanks for any help, fast replies will be much appreciated!
Phil

My friend told me about it too: He hav read about in some Netherland Atari newspaper. It has to be 68060/50MHz machine with a lot of chips from Jaguar and the speed has to be sth. about 100 MIPS!

Maybe someone has any recent info?

regards,

Simon.

Sorry - I'm no processor expert :) Better learn quick though 'cos next year I have to design a 16-bit RISC processor as part of my course! I guess I actually meant 'pipelined' but then isn't that parallel in that you have several instructions going through there at once? (Fetch, Decode, Execute) Ignore me. I'll go and do some reading tonight.

Cheers,

S.Lai

4615. NVDI 3

Newsgroup: comp.sys.atari.st
Date: 1995-09-28 00:00:00 UTC
From: lais@cs.man.ac.uk
Message-ID: <44dtch$69s@m1.cs.man.ac.uk>
Source record: 158434

I got the latest version of NVDI 3 from System Solutions about
two months ago (then I guess it may not be the latest by now <g>)
and it's all well and groovy. To test the font scaling engine
I used Wordflair from an old ST Format coverdisk, since I have no
other GDOS programs.

I didn't mess with any configuration files - I just loaded Wordflair
and the fonts were all there under the menu, didn't need to touch
anything. Well, they display nicely but using NVDI's BJ10e driver
with my BJ20 (same as a BJ10ex, just comes with a sheet feeder as
standard. Hey, I bought this in Hong Kong with an extra cartridge for
the same price as a BJ10ex alone in the UK :-)) it crashes.
Using the Epson drivers with the BJ20 in Epson mode just prints
garbage.

Anyone got any ideas? I'd love to get Papyrus - I liked the demo version
very much, but can't afford the full thing AND a mono monitor (I HATE
those mono emulators...)

Oh yes, I'm using a TOS 2.06 MegaSTe 4 if that helps.

S.Lai

4616. Polish accelerator for F030.

Newsgroup: comp.sys.atari.st
Date: 1995-09-28 00:00:00 UTC
From: Szymon Stasik <stasik@bull.mimuw.edu.pl>
Message-ID: <Pine.BUL.3.90.950928105650.26702C-100000@bull.mimuw.edu.pl>
Source record: 158435

This message is specially for atarians from Poland.
Piotr Wika from Gdynia is near to release brand new accelerator for
Falcon 030 - SpeedUp. Here are the specs:

Internal CPU: 16/20/25/40/50MHz
Internal BUS: 16/20/25 MHz
FPU: If available - up to 40MHz for 16MHz models, and up to 80MHz for
32/40MHz models.
Internal DSP: 50MHz

So the benchmarks are sth like that:

at 50/25MHz ~130% of TT with Fast RAM, and ~150% of TT without Fast RAM.

Of course all is software-configurable, so there is 100% backward
compatibility.

The bad news is that there are some serious fixes to be done on the
board, so for now only author is able to install all the stuff. Thats,
why its available only in Poland (or near the Poland) right now. I will
be able to put here some more info in next week, because he will install
SpeedUp in my F030.

for recent info write to me...

regards,

Simon.

Ah yes, it works a treat in all except 16-bit (65K) colour mode when the colours get a bit screwed up (I think it uses 15-bit). I've tried it on a TT in fast ram with the matrix tc1208 board, it's faster than my avi player definetly but not so fast. There again I've seen a software mpeg player on my 486dx66 pc under windows, that's pathetic even in black and white!!! So well done griff on an excellent program, if you get it going at 25fps you deserve a knighthood! Now, how about a way of converting an mpeg into a flc file? That would be interesting! Or better still a DA movie file....

I've only checked it in 640x200x4, but it seems to work fine. I don't
display pictures-- they bomb my computer (probably cause I only have 1
meg). But I'm still quite happy with it, it's really neat.

I do use a pair of 330Mb differential SCSI drives from Control Data
for years, for I 've been working on the subject some years ago.
Our lab designed a few prototypes of "normal SCSI" (TTL level) to
"differential SCSI" adapters for evaluation purposes. Lucky enough to get
one, I started using the whole stuff on a MEGA ST4 with an ICD adapter
for years and continue with a Flacon 030 now.

As I can remember, the cables may be up to 30 (15 ?) feet long.

This is quite possible - though just 1Mb would be very tough going. You'd probably also want to do the $5 serial port hack which ups the speed to 38400.

> Are there any cheap accelerators out for the Mega2? It has a VME bus
> slot, does it not?

It was the MSTE which had the VME port. The MST had a proprietry CPU expansion slot. I'm not aware of any CPU upgrades which used these slots anyway. CPU upgrades all seem to piggyback the existing CPU chip/socket.

:-)

: markvanwyk@aol.com

Don't know much about Compuserve - but many other access providers run
Unix boxes, which have the Unix version of the "lynx" WWW browser.

If you find one of these, log on, and at the command line $ prompt just
type
lynx http://www.charm.net/~toad <Return>

and you will get on to Toad Computers' WWW site for a start.
You will then be able to use the cursor keys on the Atari to navigate
around the links. Enjoy.

For everyone with a USR Sportster, 28.8, V.34. USR is offering a FREE PROM upgrade. The problem is a slowdown while Downloading. I've seen this many times and always figured the other end was busy and causing it.
Anyway, in the US, you have to call their (USR) BBS, 1-708-982-5092 and log in. Follow the prompts. Your will need your Serial Number so have it handy. They are saying 2 to 6 weeks. NO, it is not available at their WWW site. Outside the US, I guess you should contact your local USR dealer and go from there. One more thing; If your UCode date is Apr 1995 or newer, you don't need the update. I think the command to check is "ATI3" , some number from 0 to 7. Check your manual. One of them should return the PROM Ver and date.

If by Linix, you mean Linux - then this won't work on a 520ST of any type unless it is fitted with a expensive CPU upgrade, lots more memory and a harddisk. Probably not worth doing the upgrade IMHO.

MiNT however gives much of the functionality of Unix without the hardware requirements of Linux.

All IMHO and AFAIK.

:-)

Roland.

I took a a few courses like that a couple of years ago and it was the most
fun I ever had at the university. Especially the one where I and five
others were doing the architecture design and VHDL model, while two other
teams of about the same size were doing a compiler and an implementation
respectively.

>guess I actually meant 'pipelined' but then isn't that parallel in that
>you have several instructions going through there at once? (Fetch, Decode,

Yes, it is of course parallel in that sense, but then you should perhaps
call a full adder or shift register parallel as well.

It's really a matter of terminology. When you've read a bit about SIMD,
MIMD, VLIW, data-flow, multi-threading etc you'll find it quit difficult
to call a three stage pipeline 'parallel' as well, I think. ;-)

>Execute) Ignore me. I'll go and do some reading tonight.
^^^^^^^^^
No such luck. ;-)
I guess this part of the thread should switch to email if it's going
to continue, though.

Well :)
We use atari hardware for music production, here at Bedouin Music
because no other hardware manufacturer has come up with suitable
platforms for MIDI and powerful sampling tools.
We realise that a 14MB Atari may not seem as a power users dream but
it dose the job better than Microsloth's Windoze and any Mac.

> I assume through the desktop or CPX I am able to control which RAM to use?
> If I run a ST program in TT RAM will the program run or do you need native
> TT programs to take advantage of TT RAM?

In the first few bytes of a program file is an area reserved for "load
flags", telling the computer where the program wants to run from.

There is a "Run From TT RAM" flag, which, when set, will allow the TT to
load the program into TT RAM if enough is available.

Unfortunately, you can not have the program "half in ST, and half in TT"
RAM. When it loads it must all go into one or the other.

Once running, this limitation is lifted. The program can allocate RAM from
wherever it wants.

The Desktop does not allow you to set/alter these flags. You will need to
locate a PD utility to do so.

> 2. I saw that the TT has all standard ST ports. Can I use my ST DMA devices
> like a SLM804, hard drives, Super Charger...?

Yes. At present I have an old Megafile hard drive, and an SLM laser
printer plugged into the DMA port.

> 3. Does the TT have an internal Hard Drive adapter? If so can I just plug in
> a SCSI drive and go or do I need an ICD host for an internal drive?

A TT does not 'need' a SCSI adapter, it contains a native SCSI subsystem,
so all you need is a SCSI device (drive, scanner, monitor(!!) and cables.
The internal HD is SCSI.

> 4. What kind of monitor can I use with the TT? SC1224, SM124, VGA,
> Multisync SVGA? do you get adapters like the Falcon to match whatever
> monitor you wish to use? I am aware that a Moniterm monitor is required
> for TT high resolution.

VGA, although most TT owners I know use multisync VGA. I do not recall
anyone using Multisync SVGA, however. The ST monitors (SCxxx and SMxxx)
are NOT plug-innable.

> 5. Is ST software compatible with the TT? Or is the properly written type
> that will only? I know that the Falcon is about 50% compatible with ST
> software does the TT have the same type of compatibility problems as the
> Falcon due to the 68030 chip?

If the software was properly written it will run. The first thing to try when it fails is set it to load into ST Ram, using an appropriate util. I use the FILEINFO CPX for that purpose. One of the prime reasons that an app will fail on the TT when run in TT RAM is that the programmer messes with the top byte of the address, and, as the TT has 32-bit addressing compared to the 24-bit addressing of the ST, this will cause many a failure. (A smaller reason for program failure is that Motorola changed a few instructions beginning with the 68010, and use of these at the wrong time will crash your computer - regardless of what make/model)

4646. Flash 1.06 VT-100 Command

Newsgroup: comp.sys.atari.st
Date: 1995-09-29 00:00:00 UTC
From: dferran@crash.cts.com
Message-ID: <44fuso$32r@news2.cts.com>
Source record: 158343

I use Flash 1.06 (for now) for my .net access and it offers Vt-100
emulation. Your version probably has it, as well. In your *.do file,
add the "Mode ANSI" command, i.e.:

>MO AN|

... preferably near the beginning of the file. I've discovered that
Flash's VT-100 emulation is better than TERMINAL.EXE's VT-100 on the
Clones at work.

(The last bar of the command, BTW, is "shift backslash", and is located
just to the right of the RETURN key.)

Bull. I have done that for many, many of my customers and my own systems too.
You must of course know exactly what you're doing(!), otherwise don't bother.
Make sure that the intended PSU can provide the neccesary amount of power and
voltages i.e. don't try to run a harddisk *and* a computer off a 30 Watts PSU.
But otherwise there's no problem whatsoever.

Okay.. here goes:

==========
The Atari MicroBox

The Atari MicroBox is being developed in Sunnyvale, USA. It is based on the Falcon. The microprocessor is a 68060, running at 50 MHz.
Internal memory is 8 Mb, expandable to 128 Mb. The built-in SCSI hard drive has a capacity of 1 gigabyte. Operating system is TOS 5.0, fully multi-tasking and Atari ST(E) and Falcon compatible.
For the audio and video modules, Atari has used variants of the Tom and Jerry chips which were developed for the Jaguar. Tom is a 64-bit RISC processor, responsible for video. It has 128 pins and contains a complete 64-bit computer, consisting of a 64-bit DRAM controller for memory, a 64-bit object processor, a 64-bit Graphics Processor Unit and a 64-bit blitter. The controller is connected to 16 megabits (2 Mb) of fastpage-mode DRAM. The object processor has a speed of 27 MIPS. Any VGA monitor can be connected to the MicroBox. With the external synchronisation, this makes for a very attractive video workstation.
Jerry is a DSP chip that takes care of audio. It is a 144-pin chip, faster than the Falcon DSP chip. It has 8 Kb zero-waitstate memory, allowing for realtime stereo sound of CD quality.
The MicroBox has a built-in quad-speed CD-rom. Optionally, a MPEG card can be added, allowing playback of CD-I and CD-video.
Another optional addition is a 486DX2/66 MHz processor, allowing MS-DOS and Windows (95) programs to be run. A Pentium upgrade is being worked on.

From: szhays@bullwinkle.ucdavis.edu
Message-ID: <44g0s6$i6m@mark.ucdavis.edu>
Source record: 158346

WWW.ZIP is on all the major Atari FTP sites by now (e.g. Hensa, Umich, Cnam, etc...). I've tried it in ST-Low, ST-Medium, ST-High, Falcon-16 and Falcon-256 and it works in all of them. If you are having trouble with the cache over-flowing your disk space, try setting the cache to something less then the 100 megabytes it comes set to as a default. On a floppy drive you probably only have 720K or something, so set the cache limit as something smaller than than (and then make sure it isn't trying to keep 2 megs of that empty ;-)

Anyway, this is what we have all been waiting for. If the various authors continue to develop their respective pieces of it (Alexander Claus needs to get form and table support in there, please; and I don't know who can get it to display as it loads, but that would be nice too, I gorw weary of staring at dialogue boxes ;-) this will be a really awsome package. Even as it is now it is great.

From: contacts@walrus.megabaud.fi
Message-ID: <44gqt5$9fl@walrus.megabaud.fi>
Source record: 158354

I get a lot of messages: "Runtime Error 163 at offset 0003Bxxx"
when using my slirp connection. Rebooting the program helps for
a while. Is it a bug in the Stik?

I have 100Mb cache, all fonts etc. set, 800000 bytes for STIK
buffers. I have tried it without any ACC's or AUTO's. FPATCH2 is
active.

It works very nicely in 16 and 256 -colour modes with Screenwonder
Pro! And it's display is fast.

Nice work guys!

: figure out how to make it work? I just keep getting "Error Reading page"
: boxes when I give it a URL...

Try mucking about with the cache settings in the Options menu of
HTML-Browser. If you have a HD you are in luck, but apparently people
have been having success just using their floppy drive for the cache. Be
sure to set the cache paths undr "Paths," and the cache sives to
something _appropriate_ under "Cache." Appropriate meaning, not 100
megs, maybe 720K if you are using a floppy, and then make sure it is keep
only a small percent of that space free.

There's already an on-line version of HTML browser on ftp.demon.co.uk - and a fine program it is too (if a little unstable in this release).

WWW finaly arrives for the ordinary ST (well, actually I've now got 3 browsers on my f030 - Lynx, Chimera and now HTML+STiK online).

Craig.

4660. Tracker/ST support

If you use a terminal emulator to connect to a UNIX machine, try:
lynx -dump -source <URL> > name.html
then you can use zmodem or the like to get it to your ST or just catch a listing

:
: You remember all the utilities for the ST, right? I haven't ssen anything
: that is Falcon specific, or that works on the Falc. I know NeoDesk can do
: this, but I don't need a desktop replacement . . .

The only one I know of is Deskpic 1.05. I think the filename is something like deskpic5.* , so do an archie search for deskpic5 and you should find it.

You may have some troble with the palette getting mixed up, but if you experiment you should get around this problem. It loads GIF and (X)IMG, and probably a few other formats also. Works in all modes except 16bit colour.

Hope that helps!

4669. Extra-Floppy Size and Power question

Newsgroup: comp.sys.atari.st
Date: 1995-09-29 00:00:00 UTC
From: tkorpi@convex.csc.FI
Message-ID: <44h7ti$ri2@pobox.csc.fi>
Source record: 158366

What are the dimensions of extra floppy-drive for ST? I'm in process
of building a case for my Mega ST2 and monitor, and I plan to leave room
for (possible) extra floppy-drive. Is the hard-drive considerably larger?
I don't plan to get one (no hard-drives on the road, thank you =), but
just in case. Where are the (possible) holes for air in these things?

Another question: I plan to plug all the power-cords to one multi-connector
and use one switch to 'fire' the system up (pun not intended...). Is there
a reason why I shouldn't do this? I used this kind of system years ago with
my trusty C64, which is working (barely) fine even today. Just wondering...

Hi,

Sounds like I really did something good when coding my part. :-) Anyhow, I seem to be the one who's assembling the package each time something is updated. I've got a little script which will mail out a new version to a group of people. If you would like to be added to the list, then E-MAIL me (posting in this group will NOT get you an the list) and I'll add you. WARNING! Each release is over 200Kb once uuencoded. If you have to pay for the amount of e-mail or something on your ISP then don't do it. Updates can be quite frequent. Well, that's all for now.

No, these Runtime Errors are problems (bus errors mostly) in Cab/HTML.OVL.
If you can be more specific as to when exactly the errors occur (URL,
message on the screen, ...) I can have a look at it.

>Nice work guys!

Tnx. :-)

>
> Because I called Steve in New York less than a week ago and he assured
me
>that the problems had been solved. I don't have any particular reason to
>disbelieve him.

I do not disbelieve him. I think that the problems of fitting
an 040 to a Falcon with "dirty" clock signals is going to be
a difficult task, one i'm sure Wizztronics is up to. That is
what I ment by "can you be sure". Wizztronics developes excellent
hardware. :)

As far as the Hawk is concerned, he told me that they had had
>one up and running without problems for over 3 weeks. The man wants me
to order
>quantity and I told him I'd order when the product was ready.

Yup, that is what I was told, except that the built-in
video accelerator was not functioning properly. He said
when the boys got back from vacation, it would be fixed.
>
> >> MG> Suppose to be an 030/48mhz "Hawk" available soon for 750.00
>
> The new price from Wizztronics is US$699 including the 80Mb uppgrade
>card.

That will be a nice selling feature. If it performs as stated,
32bit Tos ect.... it should be the ultimate set-up (Until the
Barracuda is sorted out). To bad about the 72 pin simms though.
(Or has that changed also?).

> >> The Hawk documentation states "100% compatibility".
> MG>
> MG> Have you had you timing mod today? :)
>
> They were aware of the problem and say it's been solved.

If I remember correctly, they had to lift the PAL's off the
Falcon motherboard and set them on the Barracuda to get the 040
to perform correctly. The timing was to eratic otherwise.
Is this utilized on the Hawk as well?

> MG> Or the current issue of AEO. :)
>
> Haven't read AEO for the last 6 months or so, so none of what I said

came
>from there.

The last issue of AEO should not be missed. There are severl
pages covering current and upcoming Atari computer software
and hardware products.:)

Message-ID: <1995Sep29.120811.1264@rcum>
Source record: 158380

Hi
I would like to ask if someone could send me a copy of masage "BLOWUP - FX (falcon extender)" that is in the comp.sys atari.announce:, because on my server I can't get it (it blocks everything and I have to interupt it and reenter the usenet). It also bloks all the mesages that have the same date (27.09.95) and also the 22.09.95 and 25.09.95 and so on. Since it has something to do with the Blowup I would realy like to read it, but I can't. I would be very greatfull if some one would email it to me.

Thanx for help
Oblak Andrej

Did you search on the soldering side? :-)
You have to turn the PCB upside down and look near the audio in/out connectors.
All of the components are surface mounted resistors and capacitors, so you need
some experience with a soldering pen if you don't want to risk damaging the PCB
permanently...

Hi Michael,
My Diamond Edge 2.02 runs perfectly - could there be some hardware problem with
your computer or maybe a faulty disk?
What partition sizes do you use? DE can't handle partitions with a sector size
larger than 8192 bytes - just like Cubase Audio.

Good luck,

Claes

4686. Falcon STiK fix!

Newsgroup: comp.sys.atari.st
Date: 1995-09-29 00:00:00 UTC
From: gordo@dsoe.com
Message-ID: <44hm4p$4dl@sulla.cyberstore.ca>
Source record: 158383

Important information to those that have a Falcon030 with TOS
4.00-4.04, and wish to run STiK TCP/IP program.

The program will not dial the phone unless you have the program
FPATCH1.PRG in your AUTO folder.

This little patch fixes two problems in the Falcon BIOS (TOS 4.00-4.04)

(1) Sound is not initialized properly.
(2) Bconmap() doesn't work.

Nope. I'm running 2 of them, 1 on a 4Meg STe and a 2nd on
a FALCON 4/85 (+540Meg). Start rechecking all the cables and terminators.
Also, the tape isn't Write Protected is it? (Little black plastic slotted piece in
the upper left corner.) Clean the head?

Fl> What could I be doing wrong?

Check that you have version 3.50 - there were a number of changes made to tape handling in the later versions. You should be able to get an upgrade for free if you tell the retailer it won't do the job it's supposed to do.

I have a Viper but run it on an STM through an ICD AdSCSI+ host adaptor. No problems at all.

Have you checked the jumper setting on the back of the Viper?

Why not try erasing the tape?

Does DB3 recognise that the Viper is on-line (you should find it's SCSI ID and identity displayed when you configure for tape back-up).

s> Which $5 serial port hack? Inquiring minds want to know...

It involves doubling the clock speed of the serial port controller. Just
uses a 4040 chip and a bit of wiring.

If you can find this month's issue of Atari World it is described in there
by Mark Baines.

Maybe some one can help me, I really have been looking forward to the WWW-Browser day when the Atari's can also make use of this new adventure in a simple way, but I seem to have run into a little start-up problem.....maybe some one can tell me what I am doing wrong!

* I have configured the startup so that I can dail and connect and receiver my session address.

* Then I run the HTML.APP to run the browser part of the setup.

* I can then click on and "resolve host - connect to host" but nothing else
happens.

Am I missing something, doing something wrong, do I need to load anything in the Path locations. The View Source selection does not seem to do much for me either.....

Hope some one can help !!!!

Thanks.

4695. Re: TT030 Questions

Newsgroup: comp.sys.atari.st
Date: 1995-09-29 00:00:00 UTC
From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DFoKAD.Cro@cf.ac.uk>
Source record: 158392

Hi, well here's the answers to your questions :-

1. If you use an alternative desktop like ease, or one of the many utils available, it's possible to set the program and/or its memory allocation to either ST or TT ram. Virtually all the latest gem software will operte in both, the only progs that don't like the TT RAM so much are timimng critical ones like digitising software, cybersculpt (but it only affects the 3D view mode) and certain tos realtime graphic apps. Also some sample playback programs need to run in ST RAM. I run 99% of all my software in TT Ram including papyrus, magic, ease, kobold, notator logic, truepaint, trueimage, phase-4 stuff (except cybersculpt), da vektor, da picture, studio photo, imagecopy, gemview, twist, xboot, everest, 2-in-1, address, avi and mpeg players, replay 16, 525, calamus SL, outline art, etc...

2. The Tt has a standard DMA port and you can connect a harddrive or SLM804 etc to it with no probs.

3. The TT has both an internal SCSI connector (it's got a built in adaptor yes) and an external scsi port, most TT's will have a scsi drive in them, else any scsi drive can be plugged inside simply (one screw removal necessary!). THe external scsi port can be used to connect a cd rom drive and tape drive (as I do).

4. The TT monitor connector is VGA compatible, that is you need a pc type vga or svga monitor. It doesnt work on ordinary atari monitors or tv's! The connector is a standard 15-way high density D-socket as you find on most computers. This gives you all the ST modes and TT low and medium. If you want TT high (1280*960 in mono) then you need an ECL compatible monitor. I use the Eizo 21" 6500 flexscan, works a dream! It switches over with a pin held high, as ST high does on an ordinary ST. There are also a number of VME graphic cards available that plug in the TT to give you 256, 15/16 bit and 24-bit hi-rez graphics!

5. I chose the TT over the falcon because it's a lot more compatible with ST software than the latter! I have an enormous collection of ST software, though not so many games. The only programs that wouldn't run on the TT, apart from most of my older ST games, were cyberpaint, megapaint and script! All the newish gem stuff works great, it's only some of the older tos stuff, games and perhaps languages that may hiccup!

The TT is what the ST should have been many years ago, it's only now that you can pick up one 2nd hand for reasonable costs. I still miss the ability to run falcon software like apex media and direct disk recording, but the TT offers twice the processor speed, a 68030 as opposed to the 68020, a 68882 fpu built in, the ability to expand the TT ram to over 16MB easily, lots of modem ports (and quick ones!), and of course a vme

bus with hi-rez graphic card potential. It's a pity you cant add a dsp and run falcon stuff!

Hope you have luck in getting a TT, let me know if you do.....

Simon

Right, the unit's complete with a fan-cooled power supply and case.
On checking the EPROM- Ok, first let me check with the person I bought it
from. He's offered my money back on it if I can't get it to work but to
see the PROM/EPROM I'll have to pop the case open and I'd better ask him
first if I can do that without voiding the warrenty.

> Another thing, just what Sense Code do you get? Also, if

Ok, here's exactly what DB3 returns when it errors out:

Operation: Space to end of tape
Condition: NO SENSE
No specific sense code

Extended SCSI Sense Data:
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00

Unfortunately I don't have the ICD ATSCSI PRO program- I take it it's a
commercial product.

Humm, sounds like your's is mounded in a box with Power Supply.
Mine were bare Tape Drives and I installed them in my own cases. If
'Banyan' changed anything, it would be the Frimware. Look around on the
logic and try to identify the PROM/EPROM and check the label. I don't
know what should be on it but if it has 'Banyan' on it you can bet that it
has been modifited.
Another thing, just what Sense Code do you get? Also, if
you have the ICD ATSCSI PRO program you can use the SCSI
utililty to send idividual commands to it and read the resposes. It
also has a 'Define Sense Code' built into it.

4702. GEM and X

Newsgroup: comp.sys.atari.st
Date: 1995-09-30 00:00:00 UTC
From: satty@cix.compulink.co.uk
Message-ID: <DFpxCB.HE3@cix.compulink.co.uk>
Source record: 158256

This might sound like a silly Q but how much similarity is there between the structure of GEM calls e.g. wind_create, and their X counter parts - i.e are the parameters that are passed comparable?

It's just that I am going to be developing some software on my Falcon which I would also like to run under X and I was wondering if it was possible to build up a set of definitions to match X calls to their GEM counterparts which I could use in my C compiler (Lattice).
That way I could, in effect, write the prog using X calls on the Falcon and then easily port it to X.

Or may be I should do it the other way round and build up a set of GEM definitions with their X counterparts and use that on the X workstation.

Any ideas / suggestions ? or am I bonkers?

Steve.

Martin Braschler <FARAMIR@EZINFO.VMSMAIL.ETHZ.CH> wrote:
>Hi!
>
>Has anyone managed to get STiK work with SLiRP?
>The DNS server seems to work ok, but I can't get any data over the line..

I have made it work with slirp. You have to disable slirp compression, if
it's enabled as default, and set the baud rate right from slirps
end (-b 192000). The slirp works very fast in my system.
The slirp start command I use is: slirp -b 19200 -m 252
After slirp has started, I enable STIK (I use Connect in logging), exit
connect and start CAB.

I think you must have a Proxy cache server address set.

...

Too bad that today it didn't work anymore, I'll have to dig it a bit
deeper. Problem is that now it refuses to take -m 252 -switch, which
worked yesterday...

My system operators give only a Winsock -setupfile, and it contains
so many switches, that don't exist in STIK config file:

```
ip = 10.0.2.15
netmask = 255.255.255.0
gateway = 192.98.43.1
dns = 192.98.43.1
time = 192.98.43.1
domain = megabaud.fi
vector = 60
mtu = 1500
rwin = 8192
mss = 1460
slip-enabled = 1
slip-port = 2
slip-baudrate = 38400
slip-handshake = 1
slip-compressed = 1
dial-option = 2
online-check = 0
inactivity-timeout = 10
slip-timeout = 20
registration-name = ""
registration-password = "h[G?"Rgl"
```

How do those values relate to these to STIK values:

CLIENT_IP = 10.0.2.15 (this I got from "ip")
TTL = 64 (what's this??)
PING_TTL = 255 (what's this??)
MTU = 252 (this I got from "MTU", except that 1500 won't work..)
MSS = 212 (what's this??)
PKT_SIZE = 256 (what's this??)
DFB_SIZE = 580 (what's this??)
RCV_WND = 2000 (is this same as rwin?)

4708. Re: Downloading Web pages

Newsgroup: comp.sys.atari.st
Date: 1995-09-30 00:00:00 UTC
From: johnmoon@connexus.apana.org.au
Message-ID: <44jpvt$sm9@preeda.internex.net.au>
Source record: 158262

G'day from the land downunder! & welcome to cyberspace....

Ok, first of all when you want to go to a web page you do not "download"
or "ftp" one.

Web pages have a sort of "internet address" of their own which is called
an URL (Uniform Resource Locater), and is always prefixed by the letters
http:// whenever you see this you will know it is a WWW Page address.

Not knowing what sort of an account you have, but presuming it is a
UNIX "Shell" account, you can get to a WWW page by using a UNIX program
on your server called "lynx", this is a text only browser, YOU WILL NOT
SEE any graphics. To go to a home page e.g. mine, you would type at
the prompt on your site: lynx http://connexus.apana.org.au/~johnmoon

After 20 or 30 seconds you will get a text version of my home page
and all my links to other pages around the world.

Now there is one other account that you can have and that is called
a SLIP/PPP account this is a special net connection that allows you
to see web pages in all their graphic glory, but you need special
software as well. Atari computers have a couple of newly developed
browsers but unfortunately they are not in the same ballpark as
what is available on PC or MAC.

Hope this helps!

Source record: 158263

I too have this problem occasionally with my Atari STE and Gastiner Hard Drive. I have reformatted the drive numerous times in an attempt to fix the problem, an dit usually works for about a month, and then the problem returns. I have looked up the Write Fail error in my HD manual, before, but I dont remember it being very useful. the (0,0) bit means the drive with SCSI ID 0, LUN 0, in that order. And the #0001 is just the number of goes it has had at writing to the disk. If you find a solution for this problem please E-mail me direct, because I dont often get chance to read this newsgroup.

Thanks, Robert

From: CALLUM.LERWICK@flight.org
Message-ID: <0e4_9509301226@flight.org>
Source record: 158266

Well, there seems to be a major* bug in STiK. I was using v1.01, it worked great, then upgraded to 1.03 then 1.04, they both had this bug: It crashes just before the desktop comes up, two bombs. No matter what I do, two bombs. I tried STiKing it (heh) on a floppy, with nothing but the cookiejar installer I need on my TOS 1.0 machine, same thing. Arrrrggghhh! I'm back to v1.0 (cuz Demon replaced v1.01 with 1.04 so I had to get 1.0 of of Umich. grrr...) I tried running listport.tos, and it crashed just before it started checking ports. Could this have someting to do with the new DEVICE.LIB that was added with v1.02?

And: How do I go about using STiK with tia? It doesn't say "Your IP address is:" upon startup so I have no clue what to do... (yes, I know nothing about SLIP other than how to start it going...)

>Once that was done, I connected to my home at work and read today's
>Dilbert comic. Nice. Now I have a reasont to upgrade my modem.

I'm in the same position, except for the fact that whenever CAB attempts
to connect to my proxy server, it just gives me a 'Connecting to host....'
message and times out after a long while.

I'm connected w/STiK properly (I think) as I get my IP address assignment,
but I can't get CAB to do anything but time out. My modem keeps transmitting
at intervals, but it's not get anything back.....then it times out.

I'm guessing I have problems w/DNS or proxy assignments, but I'm fairly
certain I'm correct in both instances.

Anyone else have this problem?

I'm having the same problems connecting via a proxy server. I connect
w/STiK ok, but when I try to use CAB to connect to a page, it goes
hunting for my proxy with a 'Connecting to host....' message, and then
times out. Anyone give us help on this?

Just had the same problem. You have to make a directory called "CACHE"
and then set the paths to find it. If you just set the path nothing
happens, or rather it does, you get the message that you and I got!.
If you find that this works try setting the CACHE on a Ram Disk. It
really flies then.

I agree that the whole thing is great. Why can't someone write
something like STiK for the PC to replace Winsock? BTW the HTML prog
even renders the pictures.

Have fun.

I had a similar problem. I have to use an HTTP proxy on my server.
This is set in the HTML.CFG file at the bottom. It sounds like this is
your problem as well. Try changing that to the correct value and it
should work. It did for me! Your ISP should be able to give you the
info.

I only got it working today...

f> Any information would be greatly appreciated.

Easy! Have a look to see how many ROMs your current TOS is on (ought to be 6). Go for TOS 1.4 which is available on 6 ROM sets (about $40). Then just carefuly remove the current set and plug in the new ones taking care:

1.To put them in right way round - line up notch on ROM with printed notch mark on PCB.

2.To get them in in the right order. Note the position of the current set before you take them out.

Source record: 158279

In a recent CRAP COMPUTER Arcticle someone mentioned why PeeCees were so popular. My theory is as follows:

Most of the stuff normal (ie the non-computer literate) users see is a doddle to use. Stuff like windows where each program is 1/3 code and 2/3 help functions.

So what about all the underlying stuff, DOS, config.sys, memory ??? The average user hasn't the foggiest it exists, let alone how to use it !!! they just bang in WIN at the C: prompt and thats it.

So what happens when it all goes wrong ??? they call out a service repair bod and he fixes it and all is merry.

So whats the solution ??? Well trying to get people to UNDERSTAND how the computer WORKS rather than how to use it. Using it is a natural progression from understanding, indeed if you understand you are unlikely to have to keep delving into the manual, or the help fuinction. Especially if you are using a resonably user fiendly program.

Anywhere theres my bit - personally I think PeeCees are ok (I use one on occasions) however I think they are REALLY over rated, and people not even knowing there are other computers out there doesn't help. Still I prefer my good ol' Atari any day !!!

>My gawd, do you think we are completely *stupid* ?
>Who in hell wants a 1200 baud modem ?
>Maybe $5.00 is more realistic, what do you think ?
>

The SIO port, I beleve, is very desireable for an
8-bit'er. It allows the 800 or 130 to use the
PC's hard disk. If that is the item he has for
sale, it's probably worth it unless one can make
the cable on his own. :)
You should look at the 8-bit newsgroup. It's as
active as this one.

4730. Quantum Fireball + Falcon?

Newsgroup: comp.sys.atari.st
Date: 1995-09-30 00:00:00 UTC
From: Desmond_Liu@mindlink.bc.ca
Message-ID: <78612-812505628@mindlink.bc.ca>
Source record: 158284

I've recently purchased a Quantum Fireball SCSI drive (1 Gig) which I want to connect to my Falcon. But I can't get it to work because the Falcon can't seem to recognize the drive. I have the drive set to ID 0 which is required by the Atari hard disk driver. I also have terminating resistance for the drive since it's the only drive in the chain.

Both my Falcon and my ST cannot seem to recognize the drive. On my ST, I use an ICD AdSCSI+ w/clock and it has a 120 Meg Conner drive and a 170 Meg Quantum drive. I've connected it in various ways and I just can't seem to get the drive working.

I'm certain the drive works. I've connected the drive to a friend's PC with an Adaptec SCSI controller and we've been able to format the drive, copy files to it, and read files from it.

I purchased this drive from a store which normally sells Macintosh stuff, but this shouldn't matter unless Apple does something strange with their implementation of SCSI.

One thing I do find interesting is that when I try to format the drive with the Atari Hard Disk Utilities, it does a seek to scan all the drives on the SCSI bus. After it does such a seek, the drive stops spinning and the drive light slowly flashes on and off.

So are there any Atari users out there in netland with a similar working setup? Are there any known problems with the newer Quantum drives when it comes to attaching it to an Atari? It would be a shame to have to sell off this brand new drive.

Thanks in advance.

It's version 3.51.

>I have a Viper but run it on an STM through an ICD AdSCSI+ host adaptor. No
>problems at all.
>
>Have you checked the jumper setting on the back of the Viper?

Hmm.... I didn't see any jumpers on the back of the Viper - the only
setting switches on the back is the SCSI ID switch.

>Why not try erasing the tape?

Tried it- DB3 did so and came back without any errors.

>Does DB3 recognise that the Viper is on-line (you should find it's SCSI ID
>and identity displayed when you configure for tape back-up).

Oh yes- I can see the Viper just fine with DB3. I can load and unload,
retension the tape, erase it, check free space, etc. - everything in the
tape utilities section. It's when it prepares to write data to the drive
is when it has the problem.

>figure out how to make it work? I just keep getting "Error Reading page"
>boxes when I give it a URL...
>
Just had the same problem. You have to make a directory called "CACHE"
and then set the paths to find it. If you just set the path nothing
happens, or rather it does, you get the message that you and I got!.
If you find that this works try setting the CACHE on a Ram Disk. It
really flies then.

I agree that the whole thing is great. Why can't someone write
something like STiK for the PC to replace Winsock? BTW the HTML prog
even renders the pictures.

Have fun.

I've gotten hold of the STIK web browser, but haven't quite tried it
out yet- my first problem is the SLIP thingy...
Is this somethign that every net provider has? I know my provider
has PPP, but there's nothing mentioned about SLIP.
In case they have SLIP, what do I need to know?
The IP address? What else?

MATEJ GLAVAC <matej.glavac@uni-mb.si> writes:

>I would like to ask if someone could send me a copy of masage "BLOWUP - FX
>(falcon extender)" that is in the comp.sys atari.announce:, because on my
>server I can't get it (it blocks everything and I have to interupt it and
>reenter the usenet). It also bloks all the mesages that have the same date

Finally BlowUP-The Falcon Company has finished it's ultimate
extension-card for the ATARI Falcon030:
FFFFF X X
F X X
FFF XX
F X X
F X X the Falcon Xtender

And these are the Features:
FastRAM-Expansion (max. 32MB)

** 4 SIMMxSlots onboard (fits into original case)
** 4 additional slots on optional daugther-card
** 1MB and 4MB SIMMs, two-by-two
** The original 4MB of the Falcon stay active.
** With only 2*4MB and 2*1MB inserted, your Falcon then has 14MB!
** Memory over 14MB is organized virtually.
** With speeder: data throughput up to 20MB/s (standard 8MB/s).
** No soldering for RAM-function neede!
** Expansion-port daisychained! Tested with NOVA & FalconSpeed!

Hi-Speeder: CPU, DSP & Systemclock:

** Systemclock 32, 36 or 40MHz
** CPU/FPU-Clock 16,18,20,32,36 or 40MHz
** DSP 50 instead of 32 MHz
** Switchable by software.
** Soldiering needed.

Resolution-Expansion BlowUP Hard I

The original with the Video-Mode-Generator
with improved bustiming higher resolutions/refreshrates in 256
colors/TrueColor.

Installation:

If only the RAM-option is to be used, no soldering is needed for
installation. The card is simply plugged into the expansion-slot, which

is daisy-chained, so that other expansions might be used in rebuilt (tower-)Falcons. Only a small piece of the shielding has to be removed in normal Falcons. For the speeder-option soldiering is needed as with other speeders available, so that rebuilding from those other Speeders is easy. Soldiering should only be made by routine people.

Fast-RAM:

The Fast-RAM follows the Falcon RAM (4MB), the original 4MB-RAM-PCB in Falcon will still be used! There are 4 SIMM-sockets on the FX-card giving you two 16bit memory-banks. With an optional daugther-card two further Banks are available (fits only in rebuilt Falcon e.g. tower). The memory-banks may be filled with 1MB or 4MB SIMMs. This is an easy way to get 14MB with only 2 x 4MB and 2 x 1MB SIMMs. Our FastRAM can be used for all functions , including DMA-access, except video. As there are no video-accesses on the FX-RAM it is up to 50% faster in color modes. The FX-RAM normally has no problems with installed Speeders. If the Speeder on the FX-card is used, a special Page-mode will be used for RAM-access in the 32/36/40MHz-modes. This allows RAM-access with no waitstates and increases the memory throughput from normally 8MB/s to max. 20MB/s. If you don't need the speeder FX is a simple "plug'n play" memory-card.
If more than 10MB is inserted into FX the upper part is switched by the MMU an the FX-logic. The management of the extended memory is done fully invisible for all applications with the PMMU of the 68030 CPU. The speed-loss with this is minimal compared to virtual RAM on a harddisk. This optional configuration allows a maximum use of 32MB. So that 8MB are standard FastRAM (no video-access) and 24MB are EMS-RAM.
For standard applications there is no difference.

CPU-Speeder:

The Speeder included on the FX-card increases the system-clock from 32 MHz to 36 or 40MHz. The CPU then can run with 16MHz (normal), 18MHz, 20MHz, 32Mhz, 36MHz or 40MHz. With the special FX-logic now nearly all Falcon can use the 40MHz clock. The clock may be switched on booting or later with a CPX-module. We have also solved the problems some programms had with the DSP if the CPU ran at 40MHz and the DSP at 50MHz. Soldering is needed for installation.

DSP-Speeder:

Increases the DPS speed from 32MHz to 50MHz! Superb for MPEG-Decoder. Solved problems with CPU at 40MHz. Soldiering is needed for installation.

BlowUP Hard1:

The well known and time-tested resolution expansion also found a place on the FX-card. With the confortable Software and super resolutions (e.g. 800*608 at 84Hz ni, 1024*768 at 104Hz i). Soldering is needed for installation.

Technical data:
size ~160mm*65mm, simply plugged into the expansion-slot (put through)
power taken from expansion-slot 4 SIMM-sockets onboard for
1M*9/1M*8/4M*9/4M*8 SIMMs (min 70ns), with changed FIRMWARE 16M*9 can
also be used 4 additional SIMM sockets on daughter-board with 2*4MB and
2*1MB SIMMs power consumption of ~200mA. Controller chip reprogrammable by
software (Hardware-update by Software possible)

And even better!! the price: 349,-DM
Order information:
FX is now available from all ATARI dealers, our distributors in the UK,
France, Sweden and the U.S.A.
If you have problems to get it, order directly from us:
Either by normal mail - including a cheque
or by normal mail or FAX - paied by CREDIT CARD (VISA or DINERS don't
forget to include card-number and Exp. date) -
Please state the way of delivery you prefer:
UPS expedited or air-mail (with insurance - w/o insurance)
e.g. U.S.A. 90DM 45DM 30DM
e.g. London 40DM 30DM 20DM

4736. STiK issues

Newsgroup: comp.sys.atari.st
Date: 1995-09-30 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <44kqlo$hfk@gti.gti.net>
Source record: 158290

I've been running STiK since it was uploaded to demon, and have had reletively minor problems with it. Getting the cache directory to work in the proper directory was trivial, and seems to have been fixed in v1.03 (or 1.3). This version also seems a lot more stable than the initial upload; I haven't had any two-bombs lately.

But... on my Falcon, I have HSMOD06 installed, and have edited the STiK DEFAULT.CFG to comment out any SERIALPORT lines. The docs in DEFAULT.CFG state that if you've only one serial port (like the Falcon), and don't supply SERIALPORT =, then STiK will take the first one found. This is fine, and works. Click on CONNECT, and off it goes, and everything is fine.

The modem status box of STiK tells me UNKNOWN at all times. Connected or not connected. I've heard people mention FPATCH2... do I need this, or does HSMOD06 take care of that, also?

One thing I found interesting. During my initial playing around with STiK (before I had HSMOD installed), I couldn't get the STiK dialler to work. Said the hell with it, and dialled thru Connect, exited back to GEM and CAB (and IRC) works fine. However, STiK seems to grab the serial port in a strange way. Even tho Connect works, displayed characters are dropped. They are still sent and received from the modem, but not displayed. No big problem, since I have to type less than 20 characters to login...

It was none other than cj439@FreeNet.Carleton.CA who did write on 27 Sep 95
that ....
>> copy (I'm assuming that there is something more than the GUI that
>> boots up from ROM)?
c> Nope; what you see is what you get; great, eh? No system disks,
c> etc. The OS is not subtracted from your meager .5M of RAM
Whilst all the basic TOS needed is indeed on ROM it still needs to be loaded
into RAM so after initialising GEM a 520ST will have IIRC about 385K free
memory.

It is easy to do -- just go into the terminal part of the program
(pull down menu -- I forget which one) and set it for VT 100. If you
are logging on through a phone macro edit the page that you are using --

>
>which UUCP package for ATARI ST?

How much RAM? How much harddisk space?

>Recommendations, warnigs?

UPoint, Hermes, Taylor, depending on your needs.

>What about Hermes 1.10?

Needs more disk space than UPoint, doesn't handle symlinks, AFAIK, but
runs under plain TOS and is a full-fledged UUCP package working as a host
if you want it to (all AFAIK).

s> I have heard rumours that a group of people are taking Micrsoft to
s> court over their claim that Win95 works in 4 Meg when it blatently
s> doesn't.

Hmmm..I don't think this would make a court case as 95 WILL actually run in
4Mb just as Win 3.1 will run in 2Mb. Trouble is that it's difficult to run
anything else. :)
s> Does anybody know anything of this?

A far better case could be made for the claim that 95 improves
productivity. Benchmarks have been run which show that 95 degrades
performance by around 18ompared to 3.1. I hope someone tries this on as
it would be interesting to hear Macrodaft's defence. I guess they would
just donate a big Pentium to any seriuos complainant, though, and reckon
they could buy-off trouble.

4746. Q:Software 8086 emulation

Newsgroup: comp.sys.atari.st
Date: 1995-09-30 00:00:00 UTC
From: MR K P SCHUPKE <ma2@ic.ac.uk>
Message-ID: <44jn6e$2sa@oban.cc.ic.ac.uk>
Source record: 158300

Hiya ;
I was wondering if anyone knows where i can get a software
8086 emulator or PC Ditto . I need to learn basic 8086 code and
don't intend to run anything but an assembler so i would not mind
if it is slow.
Any help/hints/info etc... most welcome

Regards
Marcos Agra

: : 'Paths' menu I think. I f you don't set this to a directory that
: : exists it comes up with 'Error Reading Page' the moment you try and
: : connect to any URL...

: Well I don`t think this is the actual problem. I`ve set up STiK on my
: Falcon, and the browser works great with most servers. But when I try
: to connect to a few servers (Most notably the one where my own homepage
: is...) I get the "Receiving data 0/0", and a "Error Reading Page" after
: pressing ESC. Perhaps it is a problem with STiK not being 100% TCP/IP
: compatible?
: : Hope this helps you out, cheers, Gazza

G'day folks,
You might find the problem is due to compressed SLIP ....!!!!

I have had the same problem so I contacted Steve Adam, who is MORE than
helpful, here is part of my email to Steve.
>> Starting compressed slip for fezzy

the following is part of his reply
> Here's the problem!! My SLIP is not compressed SLIP.
> I haven't done that yet... Too bad, because I might not
> have time to do it soon, either. Ask the provider if
> they support uncompressed SLIP. (And apologise on my
> behalf for being so far behind the times :-)

The reason Steve is unable to fix it 'real quick' is that he is moving house
next week....

So ALL you Atari WEB BROWSERS, if you want to continue getting QUALITY
software at a BUDGET price (remember 'power without the price') PLEASE,
PLEASE support the three authors who have enabled STiK to get up & running

by sending in registrations (and cash) to give these hard working people
some incentive to keep development going.......

Regards

I just *knew* somebody would pull me up on this! :-)

As I own a TT I've not needed to do this myself - but I was thinking of
the one in the October Atari World - or other similar versions I've seen
in other mags.

Basically its a 4040 chip with a switch so that you can change the input
frequency to the MFP. Cost here is about 5ukp - though I would expect
it to cost about $5 or less in other countries - especially if all you have
to buy is the chip. The other parts you may well have lying around (wire,
veroboard etc).

:-)

Roland.

Remember though - early ROMs don't actually have the version number in the "About" box. You have to go on the date. 1985 is 1.00 and ISTR that 1989 is 1.4.

I'm a TT owner - but surely you are saying here that the Falcon has a 68020
whereas in fact it has a 68030?

Other that that I agree whole heartedly that the TT is a much underated
machine which is better than the Falcon in many respects.

:-)

pd@mole.bio.cam.ac.uk (Phillip Davey (Path)) wrote:
>What kind of simms does the Falcon Wing board take?

The people at Chro_Magic, who make the Ram Gizzmo, said the
Wing is a copy of their design. I don't know which is cheaper,
but the Gizz is 89.00 U.S. You may want to check with Claes
about compatibility as Chro_Magic said that there were some
problems with the Wing's design. The Gizz uses 1 or 4 meg 30 pin
simms, at least 80ns.
The Design flaw I mentioned is just what they have told me.
I have no experience with the Wing, and that statement may or
may not be true. I would at least check with a user.

>Are there any other alternative *cheap* memory boards for the Falcon?
>
>I have the chance to buy 4x4mb 30pin 9 chip, 9bit 70ns simms. Are these
>likely to work?

I use a memory expansion from PCS in Sweden. Although the instructions
do not say, I think it can only use 4 meg simms. I am using 4x4mb
30pin 9bit 60ns Toshiba's without any problems. If you are not installing
into a tower, you have to trim some of the shielding in the Falcon
to fit it. At the time of purchase, it was the least expensive at
65.00 U.S. from Toad Computers.
PCS in Vallingby, Se. 08-761 72 01
PCS in Stockholm. Se. 08-32 05 00

>Also, what is the difference between ST ram and Fast ram? Are the simms
>themselves different or is it just how the rest of the machine accesses
them.
>I would like to be able to use these simms in a future fast ram upgrade.

I <think> 60ns simms work ok for fast ram.
Can anyone verify this?

Mike
